INTRODUCTION

A discussion took place at the inaugural seminar of Czechoslovak dipterists in Nitra (26.—27. 11. 1969) upon the difficulty of keeping records of Diptera without having a standard check list in this order. The work on the preliminary shape of the list of Czechoslovak Diptera was coordinated by National Museum, Praha and the list was cyclostyl-ed by University of J. E. Purkyně, Brno (1971). The copy sent to all spe-cialists in ČSSR was discussed and complemented during all seminars of Czechoslovak dipterists arranged by various dipterological workplaces in Czechoslovakia and during special small meetings on the subject of the check-list. After the 8th seminar of Czechoslovak dipterists in České Budějovice (24.—27. 9. 1984) the check-list of Diptera was fi-nished and prepared for the press. On the territory of ČSSR now occur 104 families of the order Diptera with 6498 species of 1500 genera and 251 subgenera. The check-list of Czechoslovak Diptera compiled by 52 authors will undoubtedly be most useful to serious students, be they professionals or amateurs, specialists or general workers. It lacks finality in some of the little worked groups, unfortunately, but it should inspire further work rather than attract criticism.

Jan JEŽEK,
coordinator of the dipterological part
of the Check-list of Czechoslovak Insects

The type used in the case of names for taxonomic units and their synonyms have been inset to different measures. The following type faces have been used in the body of the list (as distinct from headings):

FAMILY
Subfamily
Tribus
Subtribus
Genus
Subgenus
Species
Synonyms

Prefixes * species new to mentioned area, not published so far
B Bohemia
M Moravia (including Silesia)
S Slovakia
? doubtful literary data or queried data
introd. introduced species

An ascending order of all families of the acalyptrates is suggested by J. Roháček and J. Máca. References to old literature in „Selected literature“ are limited by year 1945; all former references are listed in the valuable bibliography of Rozkošný, R. (1971); Bibliography of Diptera in Czechoslovakia 1758—1965. Taxonomy and faunistics. Univ. JEP, Brno, 240 pp.

TRICHO CERIDAE

Jaroslav MARTINOVSKÝ

The identification of the species of this family is only possible on the basis of the structure of the aedeagal complex. The sporadic literary data are therefore little reliable. The present list is based on the data published by Vimmer [1913] for Bohemia, Czižek [1931] for Moravia and Thalhammer [1899] for Slovakia. In addition to a few further literary records, also hitherto unpublished results of the study of the author's collection, have been included. 11 species of Trichoceridae are now known to occur in Czechoslovakia. The occurrence of a further 4—6 species is possible.

TIPULIDAE

Jaroslav MARTINOVSKÝ

Historical records of the species of the family Tipulidae are not numerous and they mostly have to be critically evaluated. The oldest reports were published by Kolenati (1859) for Moravia and Fritsch (1875) for Bohemia, Moravia and Slovakia. Somewhat more extensive faunal lists were provided by Dalla-Torre (1878), Kowarz (1894) and Vimmer (1913) for Bohemia, Czižek (1911, 1913) for Moravia and Thalhammer (1899) for Slovakia. A number of further records are scattered in papers by Brancsik, Fekete, Lackschewitz, Landrock, Riedel and others. After the World War II further finds from the territory of Czechoslovakia were published by Mannheims (1951—1968), Martinovský (1968—1974), Oosterbroek (1978—1979), Savtshenko (1961—1973), Slípka (1948—1951), Theowald (1973—1980) and others. Historical collections of Tipulidae deposited in the National Museum, Praha and Moravian Museum, Brno have been re-examined by the author and the results of these hitherto unpublished revisions are included in the present list. A few literary data have thus proved to be based on misidentifications and have therefore been omitted. On the basis of critically evaluated literary data and a systematic study of the extensive collection made by the author 137 species of Tipulidae have been found to occur in Czechoslovakia. 6 species are still known from previous literary data only. The records of the remaining 131 species are based on the author's personal study of specimens from this country. At present, Czechoslovakia belongs to the best investigated European countries as far as Tipulidae are concerned. The faunistic research, however, seems not to be finished. Comparing the faunas of the neighbouring countries the actual number of species occurring in Czechoslovakia may be estimated at 150.

CYLINDROTOMIDAE

Jaroslav STARÝ

The present list is based on the data published in the older faunistic literature, confirmed, in some cases, by revision of the relevant specimens. Further records were recently added by the author (Starý et Martinovský, 1969; Starý, 1984). In Europe, only two more species are known to occur (*Cylindrotoma nigriventris* Loew, 1849; *Diogma caudata* Takahashi, 1960 — cf. Tjeder, 1975) these representing possible additions to the Czechoslovak fauna.

Selected literature: Starý J., 1984: Doplnky k faunistice čeledi Cylindrotomidae (Diptera) v Československu. *Zpr. Kraj. vlastiv. Mus. Olomouc*, **231**: 10—14. — Starý J. et Martinovský J., 1969: Tiplicovití (Tipulidae, Diptera) Černovířského lesa u Olomouce. *Práce oboru přír. věd Vlastivěd. ústavu v Olomouci*, **14**: 1—19. — Takahashi M., 1960: A revision of Japanese Cylindrotominae (Diptera: Tipulidae). *Trans. LIMONIIDAE

Jaroslav STARÝ

Until recently, the knowledge of the family Limoniidae in Czechoslovakia was very slender. Somewhat more numerous faunistic data had been brought together in the publications by Kowarz (1894) and Vimmer (1909) [for Bohemia], Czižek (1931) [for Moravia] and Thalhammer (1899) [for Slovakia]. Later, only relatively few papers appeared reporting on some additions to the existing faunal lists. Only some twenty years ago a more detailed faunistic research was started, connected with a taxonomic study of the family. All previously published data were critically evaluated and virtually all specimens deposited in the Czechoslovak museums revised (Starý, 1969, 1971b, 1980). Further extensive material collected recently has been examined (numerous papers by the author, e. g. Starý, 1971a, 1974, 1981, 1986). The number has thus been increased to the 344 species-group taxa presently listed, 25 of them having been described as new from this country. Records of all but two are based on the author's personal examination of material from the territory of Czechoslovakia. At present, the number of species known from Czechoslovakia is by far the greatest of all European countries. Yet, judging from the occurrence in the adjacent territories, still further species are to be expected here. Moreover, the knowledge of the fauna of Bohemia remains rather inadequate compared with that of the two other major regions. Faunistic research of the Limoniidae cannot therefore be considered to be finished and the number of species to occur actually in Czechoslovakia may be estimated at about 400. The classification adopted here is based on that proposed recently by Savchenko [cf. e. g. Savchenko et Krivolutskaya, 1976] who modified the sequence of taxa and re-instated some subgenera to their originally assigned generic rank. Further changes have been made by the author mostly affecting the categorical rank and delimitation of some supraspecific taxa, and re-establishing as valid a few formerly synonymized genus-group names.

Selected literature: Savchenko E. N. et Krivolutskaya G. O., 1976: Limoniidae of South Kuriles and the southern Saghalien. 160 pp., Naukova Dumka, Kiev (in Russian). — Starý J., 1969: Revision der Arten der Unterfamilie Limoniinae [Tipulidae, Diptera] aus den Sammlungen des Mährischen Museums in Brno mit besonderer Berücksichtigung der Fauna Mährens. Teil I.: Tribus Limoniini und Pediciini. *Acta Mus. Mor. (sci. nat.)*, 54: 131—180. — Starý J., 1971a: Einige für Mähren neue oder wenig bekannte Limoniinen (Tipulidae, Diptera). *Acta Mus. siles. (ser. A)*, 20: 69—84. — Starý J., 1971b: Revision der Arten der Unterfamilie Limoniinae [Tipulidae, Diptera] aus den Sammlungen des Mährischen Museums in Brno mit besonderer Berücksichtigung der

PTYCHOPTERIDAE

Rudolf ROZKOŠNÝ

A comprehensive study of the Czechoslovak species including a critical evaluation of all the published data, a revision of preserved documentary material as well as many recent records were published by Zitek—Zwyrtek (1971). Nine species are known to occur in our territory from 13 living in the whole of Europe. All the species seem to be well distinguishable and their taxonomic status is sufficiently elucidated. A further faunistic investigation may enlarge our information on the real distribution in Czechoslovakia but additional species to our fauna are unlikely.

Selected literature: Zitek-Zwyrtek K., 1971: Czechoslovak species of the family Ptychopteridae (Diptera). *Acta ent. bohemoslov.*, **66**: 416—426. — Zwyrtek K. et Rozkošný R., 1967: *Ptychoptera silvicola* sp. n. — eine neue Ptychopteriden-Art aus der Ostslowakei (Diptera). *Acta Mus. Mor. (sci. nat.)*, **52**: 197—200.

PSYCHODIDAE

Jan JEŽEK and Jozef HALGOŠ

The investigation of Psychodidae in Czechoslovakia is still far from finished. Scattered older literary data of moth flies published e.g. by Enderlein (1936) as well as by other authors registered by Rozkošný (1971) were critically revised from the viewpoint of the contemporary state of taxonomy. A modern research of Psychodidae in Slovakia was founded by Szabó (1965 a, b) and Vaillant (1966) revised the material of moth flies of the Moravian museum in Brno. Rozkošný (1971) raised the number of Psychodidae known from Czechoslovakia to 44 species. Halgoš (1973—1975, 1984) and Ježek (1977, 1979, 1982—1986 f) carried out the faunal investigation of Czechoslovak Psychodidae as well as the taxonomic research of this family in general with a study of the type material of problematic species. In the adjoined preliminary faunal check-list there are 86 species in 37 genera. The occurrence of at least several further decades of species in Czechoslovakia is very probable considering the distribution of Psychodidae in the neighbouring countries and with respect to the numerous material collected recently by authors on the whole territory of Czechoslovakia.

BLEPHARICERIDAE

Ján GULIČKA

The list is based on the mature stages only or on the mature individuals prepared from the nymphae. The present list is based on the author's own material, of J. Komárek and also other Czechoslovak zoologists, and on the published but critical revised literary data. The distribution of the species is based on the hypopygial structure of the male copulatory organs only. Faunistic and taxonomic investigations are not yet completed; at the present period are known 2 genera 7 species from the territory of Czechoslovakia.

Selected literature: Gulička J., 1966: Die Blepharoceriden der Mittel- und Süd-europas und des Kaukasus. *Acta Rer. natur. Mus. nat. slov.*, Bratislava, 12 (2): 45—150 — Gulička J., 1984: Čelad: Blephariceridae. In Čepelák J. (ed.), *Diptera Slovenska I*, pp. 51—52. Veda, Bratislava.

DIXIDAE

Jan KNOZ

No special attention was paid to the study of this family on the territory of Czechoslovakia practically up to the present. The records presented here are based on scattered literary data and material collected by Knoz, Martinovský, Rozkošný and Špačková. More frequent species have been mentioned by Kowarz (1894), Strobl (1901), Czižek (1910, 1916) and Vimmer (1913, 1931).

CHAOBORIDAE

Vladimír SLÁDEČEK and Věra STRAŠKRABOVÁ-PROKEŠOVÁ

The list is based on the immature stages only. Larval stages of the genus *Chaoborus* Licht. were generally designated as „*Corethra plumicornis*“ in the older literature. The first Czech key for the determination of species together with the data on distribution in Czechoslovakia was published by Sládeček (1952), a more detailed one by Prokešová (1959). The pupae were used in few cases and the imagines were almost totally neglected. The distribution of the larvae of genus *Mochlonyx* is very little known. The present list is based on the personal material of the authors and on the published and unpublished data (diploma thesis) from the main hydrobiological institutions in Czechoslovakia. There are two genera and 6 species found. Faunistic investigations are not completed but it is doubtful if additional species will be discovered on the territory.

CULICIDAE

Jan MINÁŘ and JAROSLAV KRAMÁŘ

The family Culicidae has been relatively well studied in Czechoslovakia on the basis of research of adult and larvae. Only a limited number of faunistic data from the Czechoslovak territory was recorded in older literature concerning the current species of mosquitoes (Kowarz, 1894; Thalhammer, 1899; Vimmer, 1931; Schneider, 1920; Komárek, 1922 etc.). In the post-war period the results obtained in mosquito research were published in many papers by Kramář (1949a, b, 1951, 1952, 1954, 1957 etc.) and by some other workers (Korběl, 1950; Kramář et Weiser, 1951; Rosický et Havlík, 1951; Rosický et Weiser, 1952 etc.). Kramář first treated comprehensively the genus *Aedes* (1955) and later the entire family in monograph published in the series Fauna ČSR (1958). In this book 42 species are listed. The occurrence of other species has been recorded by Kramář and Minář (1961), Trpiš (1962, 1964, 1965), Ryba et al. (1974). Mosquitoes of some regions, mainly in areas of their abundant occurrence, have been treated in separate papers (Trpiš, 1962; Hájková et Minář, 1970; Rettich, 1973; Minář, 1975; Labuda, 1977 etc.). Many data on mosquitoes are to be found in ecological and epidemiological papers published in the past 20 years.

At present 6 genera, 45 species and 3 subspecies (a total of 48 forms) are known to occur in Czechoslovakia. According to the research done in Czechoslovakia and in the adjoining countries the occurrence of a few more species is possible.

CHIRONOMIDAE

Jan LELLÁK and Bohumil LOSOS

The groundwork of the species schedule is extracted from published papers. In the list is included also new information from the collections of both authors. Some new data were also obtained as a result of revision of the slide collection from the inheritance of Professor Jan Zavřel, the great specialist in Chironomidae taxonomy. The data on the findings from Slovakia are taken from the paper Ertlová et Lellák (1984). The nomenclature of the Chironomidae taxa is taken into concordance with Fittkau et Reiss (1978) in Limnofauna Europea.

CERATOPOGONIDAE (HELEIDAE)

Ivan ORSZÁGH and Josef CHALUPSKÝ

Up to now, only a few authors have pursued the study of biting midges in Czechoslovakia. The earliest known review of the species in Czech territory is to be found in Kowarz's work from the year 1894, listing 8 species but without giving particulars as to date and locality. Five years later, a review of Diptera in Hungary (Thalhammer, 1899), fairly well processed for the period, appeared. At about this time, Vimmer in Bohemia, alongside several minor studies in which he also touched on Diptera, summarized his findings of 14 species and published them in 1907c and 1913c. Later he published these same data again, with minor modifications (1913a). In Slovakia, Brancsik's work appeared in 1910 and was subsequently supplemented by Fekete (1914). Both studies list 7 species from the region of Trenčín. In 1917, Zavřel published a minor paper on 6 species from Bohemia and Moravia. In 1919, Kieffer published an extensive work on a collection of midges (including Ceratopogonidae) of the Budapest museum. In the section dealing with Ceratopogonidae he described several new species on the basis of material coming from the territory of Slovakia. During the interwar period, no home author, excepting Zavřel (1935a, b) and Mayer (1938a), studied biting midges. Of value for a knowledge of this species in Slovakia is the monograph by Zilahi-Sebess (1940) who was the first Central-European author to have thoroughly studied and sketched hypopygia of males of numerous species. After World War II, biting midges have been dealt with in Bohemia and Moravia by Knoz (1978), Knoz et Vaňhara 1982), in Slovakia by Callot, Kremer et Paclt (1968), Országh (1980), Remm (1973, 1981) and others.

All the literary data on biting midges in Czechoslovakia were critically appraised when being processed for the present study and the latter thus constitutes an account of the contemporary state of the as yet unfinished faunistic research on our territory. The absence of some species in Bohemia and Moravia may be only illusory, related to the lesser attention paid to this family in countries mentioned (in contrast to Slovakia).

Up to now, a total of 146 species and 15 genera of Ceratopogonidae have been determined on the territory of Czechoslovakia, the estimated numbers being about 250 species and 19 genera of this family.

The authors express their grateful acknowledgements to Prof. H. Remm (Tartu) for his valuable suggestions and supplements to their list of Czechoslovak biting midges.

SIMULIIDAE

Jan KNOZ

Relatively a very frequently investigated group of Diptera on the territory of Czechoslovakia, especially in the last 20 years. There are a few data scattered in the older literature too: Landrock [1908], Kowarz [1894], Vimmer [1913, 1931]. The first characteristics of 22 black-fly species distributed in our country are given by Novák 1956. The first monograph concerning the identification of Czechoslovak black-flies was published by Knoz, 1965. The second one, including characteristics, ecology and distribution of 48 species of the territory of Czechoslovakia, was published by Knoz (1980) in Fauna ČSSR. In this work there are included data about the authors's findings and investigations as well as of the other authors: Novák [1959], Minář [1962, 1965], Hájková-Hlisnikovská [1962], Knoz et Šašínková [1969], Knoz [1960, 1961 a—c, 1963a, b, 1974], Jedlička et Trpiš [1971], Jedlička [1968, 1970a, b, 1971, 1976], Halgoš et Jedlička [1971], Halgoš [1970, 1971, 1972], Jedlička et Halgoš [1972].

The last new species for Czechoslovakia (*Simulium voilensis*) was discovered by Jedlička et Halgoš [1982]. Altogether 11 genera with 49 species were recorded from Czechoslovakia. Judging by the records from the neighbouring countries about 55—60 species can be expected to occur in Czechoslovakia in reality.

Selected literature: Jedlička L., 1982: Types of Black-fly breeding places in Slovakia (Diptera, Simuliidae). *Wlad. parazyt.*, 28: 37—40. — Jedlička L. et Halgoš J., 1982: *Simulium voilensis* Serban, 1960. THAUMALEIDAE

Jaroslav MARTINOVSKÝ and Rudolf ROZKOŠNÝ

All the earlier records of Thaumaleidae from the territory of the ČSSR have only been published under the name of *Thaumalea testacea* Ruthé. Older material of this relatively rare family have been virtually not found in any Czechoslovak institution. Consequently, a taxonomic and faunistic study by the authors (Martinovský et Rozkošný, 1976) was based mainly on their recent records from Moravia and Slovakia. The faunal investigation appears to be by far not finished and several additional species to our fauna will certainly be recorded.

Selected literature: Martinovský J. et Rozkošný R., 1976: Four new species of Thaumaleidae [Diptera] from Europe with taxonomic and distributional notes on other species. *Acta ent. bohemoslov.*, **73**: 187—205.

MYCETOPHILIDAE

Petr LAŠTOVKA

The fauna of this family, especially that of Moravia, was extensively studied by Landrock (1911—1940). The faunistic data published by him mostly are of high taxonomic accuracy. The older records from the other parts of the territory are scattered in faunistic papers of wider scope and for the most part are taxonomically unreliable, judging from the revision of the preserved material. Recently Laštovka (1963, 1966, 1971, 1972a, b, and 1974) and Laštovka et Matile (1972) published taxonomic and/or faunistic revisions of some groups of the family. Some additional faunistic records have also been presented in the papers by Laffoon (1957), Zuska et Laštovka (1969), Máca (1977) etc. The present list is based on the published data (pertinent specimens in some groups were checked) and on a study of some private and institutional collections. It includes 379 species belonging to 69 genera. With respect to both incomplete faunistic research and, especially, many taxonomic problems to be solved, about 600 species can be expected to occur in our territory.

SCIARIDAE

Petr LAŠTOVKA

Up to the present no faunistic research of this family has been carried out in Czechoslovakia. Sporadic data on the occurrence of certain species are presented in more general faunistic, coenological and phytopathological papers. Only the brachypterous forms of the family have been studied more completely, namely by Vimmer (1926, 1931) and Kratochvíl (1936 a, b, c). However, these records are mostly unreliable, considering the low level of the taxonomy of the group at that time. Recently, scanty faunistic records appeared in the papers by Martinek (1973), Gregor et Povolný (1961), Zuska et Laštovka (1969) and Máca (1977). Several mining species were recorded by Zavřel (e.g. 1967, 1972, 1973 and 1974). The present list includes all literary data which possess a certain degree of reliability. In some cases the preserved material was revised. 62 species in 16 genera are listed from Czechoslovakia, at least twice as many species can be expected to occur here. However, faunistic research of the family must be necessarily preceded by thorough taxonomic revisions of genera rich in species such as *Lycoriella*, *Bradysia* or *Corynoptera*.

CECIDOMYIIDAE

Marcela SKUHRAVÁ

The study of phytophagous species of this family has a long tradition on the territory of Czechoslovakia. The species of the family Cecidomyiidae attracted the attention of research workers already in the last century [Handlirsch, 1884; Wachtl, 1884—1887; Hieronymus 1890] by their biology — by forming galls on plants. In the 20th century, Vimmer (1905—1937) engaged in this study and described several new species. Bayer (1910—1946) and particularly Baudyš (1913—1968) collected galls produced by gall midges on the territory of Czechoslovakia.

In the years 1955—1975 there was carried out a planned, systematic faunistic research of phytophagous gall midges at more than 1000 locations in Czechoslovakia [Skuhrová, 1957—1981]. Czechoslovakia is from the point of view of the study of phytophagous gall midges the best investigated territory in the world. In this faunistic research attention was not paid to the zoophagous and mycophagous gall midges species, which must be studied by different sampling methods.

All the literary data are critically elaborated in the list. Most data by former authors on distribution of the galls of gall midges were verified by the determination of larvae obtained from our own samplings and rearings. A number of taxonomic problems have not been solved and many species, known only by the galls or larval instars, have not yet been described. So far 513 species classified in 112 genera have been determined on the territory of Czechoslovakia. Many species, above all those the larvae of which are zoophagous and mycophagous, may be discovered in the future.

SCATOPSIDAE

Petr LAŠTOVKA and Jaroslav MARTINOVSKÝ

The faunistic records of Czechoslovak Scatopsidae are most scarce. Apart from several obsolete data (Kowarz, 1894; Landrock, 1910; Vimmer, 1913 etc.), few records are in the papers by Duda (1929), Vimmer (1935), Pax et Maschke (1935), Cook (1956), Zuska et Laštovka (1969), Máca (1977), Lauterer (1978) and Laštovka et Haenni (1981). The present list is mainly based on these literary data. It includes 15 species belonging to 10 genera. When extensive faunistic research, which is still negligible, will be made, we can expect about 50 species to occur in Czechoslovakia.

Selected literature: Cook E. F., 1956: A contribution toward a monograph of the Scatopsidae (Diptera). Part VI. The genera Scatopse Geoffroy and Holoplagia Enderlein. *Ann. ent. Soc. Am.*, 49: 593–611. — Laštovka P. et Haenni J.-P., 1981: Scatopse globulicauda sp. n. from the European Alps, with notes on S. notata (Diptera, Scatopsidae). *Acta ent. bohemoslov.*, 78: 340–347. — Lauterer P., 1978: New records of Diptera from Moravia and Slovakia. *Acta Mus. BIBIONIDAE

Pavel PECINA

In Czechoslovak Dipterology, few authors have so far attended to the family Bibionidae. Apart from a few papers (Horník et Nolč, 1931; Robek, 1930; Baudyš, 1933; Uzel, 1908) with the phytopathological aims, there are some by Vimmer (1911, 1925) on the morphology of the larval stages of the most common species. From the faunistic point of view the family has been dealt with by Kowarz (1894; Bohemia), Thalhammer (1899; Slovakia), Landrock (1908; Moravia), Czižek (1908; Moravia), Brancsik (1910; Slovakia), Vimmer (1913; Bohemia) and Fekete (1914; Slovakia).

The list is based on the critical revision of the material from all the great Czechoslovak museums, author's and other dipterologist's collections. Up to this time, two subfamilies, three genera and 21 species belonging to the family Bibionidae were recorded from the territory of Czechoslovakia. In southern Slovakia or in the high mountains, some other species of the genus *Biblio* new to the Czechoslovak list may occur.

Selected literature: Pecina P., 1962: *Biblio benesi* sp. n. (Diptera, Bibionidae), a new March-fly found in the High Tatra mountains. *Acta Soc. ent. Českoslov.*, 59(1): 4—79. — Pecina P., 1965a: Muchnice (Bibionidae, Diptera) Moravy. *Acta Mus. Mor. (sci. nat.)*, 50: 191—200. — Pecina P., 1965b: Three species of March-flies of the genus *Biblio* Geoffroy (Bibionidae, Diptera) new to Czechoslovak fauna. *Acta ent. bohemoslov.*, 62(3): 235—237. — Pecina P., 1965c: Bohemian March-flies (Diptera, Bibionidae) in the National Museum, Prague. *Acta faun. ent. Mus. Nat. Pragae*, 11: 285—298. — Pecina P., 1966: Příspěvek k faunistice muchnic (Bibionidae) Slovenska. *Acta Rer. natur. Mus. nat. slov.*, Bratislava, 12(1): 129—133.

ANISOPODIDAE

Ivo KOVÁŘ

No special attention was paid to the study of this family on the territory of Czechoslovakia up to the present. The list is based on older, mostly Bohemian material deposited in the National museum (Nat. Hist.) in Prag, published already in catalogues of Kowarz (1894) and Vimmer (1913), and redetermined recently by B. V. Pedersen. Other distributional literature data are also included, namely from Lindner (1930) and Soós (1940). From the new material of the mentioned museum was determined by the authors *Sylvicola fuscata* [F.] as a new species for Bohemia. All ascertained species may probably occur in all parts of Czechoslovakia.

Selected literature: Freeman P., 1950: Family Anisopodidae (Rhyphidae). *Handb. Ident. Br. Insects*, 9(2): 70–72.

MYCETOBIIIDAE

Petr LAŠTOVKA

The group was revised taxonomically only recently. Older records of *Mycetobia* were all published as those of „*Mycetobia pallipes*“, the only species then recognized. The second species was reported from Czechoslovakia by Máca [1977]. Additional 2—3, recently described, species could be found in Czechoslovakia.

Selected literature: Máca J., 1977: Příspěvek k poznání dvoukřídlého hmyzu (Diptera) jižních Čech. Sbor. Jihočes. Muz. Čes. Budějovicích, Přír. vědy, 16: 103—140.

ATHERICIDAE

Rudolf ROZKOŠNÝ and Karel SPITZER

Species of Athericidae were originally treated in the family Rhagionidae and, consequently, also included in the revision of Czechoslovak species of Rhagionidae (Rozkošný et Spitzer, 1965). Documentary material from the main collections as well as published literary records were thoroughly re-examined. Three species are known to occur in Middle Europe and all are found also in Czechoslovakia. Two of them, *Atherix ibis* (F.) and *A. marginata* (F.), are widespread and rather frequent along the not too polluted running waters whilst *Atrichops crassipes* (Meig.) is still known only from one locality in Slovakia. A certain attention has also been paid to the biology and larval development (Ošmera et Spitzer, 1969; Vaňhara, 1975).

Selected literature: Ošmera S. et Spitzer K., 1969: Číhalka *Atherix ibis* (F.) (Diptera, Rhagionidae) v jižních Čechách. *Sbor. Jihočes. Muz. Čes. Budějovicích*, Přír. Vědy, 9: 34–38. — Rozkošný R. et Spitzer K., 1965: Schnepfenfliegen (Diptera, Rhagionidae) in der Tschechoslowakei. *Acta ent. bohemoslov.*, 62: 340–368. — Vaňhara J., 1975: Larval development of *Atherix marginata* (Diptera, Athericidae) under natural conditions. *Acta ent. bohemoslov.*, 72: 92–98.

RHAGIONIDAE

Rudolf ROZKOŠNÝ and Karel SPITZER

A seriously needed basic revision of the European species of the family is still only expected. So also our revision of the Czechoslovak species [Rozkošný et Spitzer, 1965] though including characteristics of the male terminalia for the first time, followed conventional nomenclature as the other recent faunistic papers. Apart from it, all available material, both historical and that from recent authors' collection, was examined and all literary records were summarized. The number of Czechoslovak species will probably not increase but the study of the real taxonomic status of some rarer species appears as necessary (e. g. *Ptiolina* Zett.).

Selected literature: Rozkošný R. et Spitzer K., 1965: Schnepfenfliegen (Diptera, Rhagionidae) in der Tschechoslowakei. *Acta ent. bohemoslov.*, 62: 340–368. — Spitzer K., 1983: Biogeography of some little known Palaearctic species of Rhagionidae (Diptera). *Věst. čsl. zool. Spol.*, 47: 122–125.

HILARIMORPHIDAE

Rudolf ROZKOŠNÝ

The sole genus of this family has been placed variously in the Rha-gionidae, Bombyliidae or Empididae by most previous authors but the separate family appears to correspond best to recent phylogenetic studies. Two European species were discovered in Austria and only one of them was later recorded at Piešťany [Szilády, 1934] and along the Tisa River in Slovakia [Chvála, 1977].

S

COENOMYIIDAE

Rudolf ROZKOŠNÝ

Coenomyia Latreille was often treated as a member of the family Xylophagidae (or Rhagionidae) by earlier authors because the separate family Coenomyiidae was definitively established only recently. The sole, conspicuous and relatively well-known Holarctic species is distributed all over Czechoslovakia. It has been recorded in virtually every larger faunistic list of our earlier authors (e.g. Dalla Torre, 1878; Kowarz, 1883, 1894; Thalhammer, 1899; Czižek, 1906; Landrock, 1907; Brancsik, 1910; Vimmer, 1913; Slavíček 1930), also mentioned in some recent papers (e.g. Čepelák, 1974, 1979, 1980, 1981a, 1981b) and documented by extensive material in author's collection.

Selected literature: Čepelák J., 1974: Niektoré skupiny vyšších múch (Diptera, Brachycera) Sušovských skál. In: Sušovské skaly, pp. 345–362, Martin. — Čepelák J., 1979: Stručný přehled dalších poznatků o některých čeledích vyšších dvoukřídilých v Krkonoších (Diptera, Brachycera). *Opera corcont.*, **16**: 161–167. — Čepelák J., 1980: K rozšíření a biologii vyšších dvoukřídilých severní Moravy a Slezska (Diptera, Brachycera) I. *Čas. XYLOPHAGIDAE

Rudolf ROZKOŠNÝ

The Czechoslovak fauna embraces all the known European species but their distribution is known only insufficiently [cf. Rozkošný, 1977]. The records presented here are based on scattered literary data and rather poor material from the main Czechoslovak natural history museums and author's collection. More common species have been mentioned by Stein (1873), Dalla Torre (1878), Petrogalli (1890), Kowarz (1894), Thalhammer (1899), Vimmer (1913), Fekete (1914), Czižek (1925), Slavíček (1930), Bafa (1935), and Čepelák 1980a, 1980b).

Selected literature: Čepelák J., 1980a: Príspevok k poznaniu múch (Diptera, Brachycera) Biatnickej doliny a Gaderskej doliny. *Ochrana prírody*, 3(c): 181–202. — Čepelák J., 1980b: K rozšíření a biologii vyšších dvoukřídlých severní Moravy a Slezska (Diptera, Brachycera) I. *Čas. XYLOMYIDAE (SOLVIDAE)

Jindra DUŠEK and Rudolf ROZKOŠNÝ

The Czechoslovak Xylomyidae were revised as a subfamily of Stratiomyidae in the framework of a study on Central-European species of soldier flies. Virtually all material available from the main Czechoslovak museums, that from the authors as well as from some private collections has been examined. All 3 Central-European species of Xylomyidae have been recorded from the ČSSR: *S. marginata* (Meig.) as the most common (see Kowarz, 1883; Thalhammer, 1899; Czižek, 1906; Landrock, 1907; Vimmer, 1913; Fekete, 1914), *S. maculata* (Meig.) known only from several localities (Kowarz, 1883; Thalhammer, 1899) and *S. varia* (Meig.) found only recently (Dušek et Rozkošný, 1963, where also additional records of two preceding species are included).

Selected literature: Dušek J. et Rozkošný R., 1963: Revision mitteleuropäischer Arten der Familie Stratiomyidae (Diptera) mit besonderer Berücksichtigung der Fauna der ČSSR. I. *Cas. čs. Spol. ent.*, **60**: 202—221.

STRATIOMYIDAE

Jindra DUŠEK and Rudolf ROZKOŠNÝ

The Czechoslovak Stratiomyidae were re-examined recently in a study of Central European species (Dušek et Rozkošný, 1963a—1975). All documentary material from collections was re-determined, the published faunistic data were critically evaluated and relatively large recent material from many Czechoslovak localities was examined. Some newer records are also included in systematic studies by the same authors (Dušek et Rozkošný, 1963b, 1968, 1970; Rozkošný, 1977, 1979) and in faunistic papers by Martinek (1973, 1976), Máca (1977), Rozkošný, (1978a, b), Čepelák (1979a—d, 1980a, b, 1981a, b, 1982), Gregor (1979), and Čepelák et Čepelák (1983). The nomenclature, which is adopted here, follows a comprehensive monograph of the European species published recently by the junior author (Rozkošný, 1982, 1983). Although the further faunistic research in the ČSSR is needed, discovery of additional species to the fauna is hardly possible.

TABANIDAE

Milan CHVÁLA

The present list is based on an extensive Czechoslovak literature on horse flies consisting of more than one hundred papers published on the Czechoslovak fauna in the last 30 years. Besides the faunistic and taxonomical papers a long series of ecological papers was also published. About ten papers deal with immature stages, the summarizing paper on larvae and pupae was published by Ježek (1977). All these studies resulted in a detailed monograph of Czechoslovak Tabanidae in the series „Fauna ČSSR“ (Chvála, 1980). Altogether 63 species in 10 genera have been found recently on the territory of Czechoslovakia, but at least 6 further species may still be found, including *Nemorius vitripennis* [Meigen, 1820] which occurs close to the eastern borders of Czechoslovakia. In the last twenty years the family has been intensively studied also taxonomically and the nomenclature, both on generic and specific level, for instance in the genus *Hybomitra*, has changed very much. The large number of different names [both synonyms and errors], often used in old Czech and Slovak literature, are (for brevity) not given in the present list; for details see the recent monographs of Chvála, Lyneborg & Moucha (1972) and Chvála (1980).

ACRO CERIDAE

Milan CHVÁLA

The list is based on the very recent revision of Czechoslovak species (Chvála, 1980). Nevertheless, because of the very scarce occurrence of adult flies in nature, the Acroceridae are still only poorly known in Czechoslovakia. First record available from Czechoslovakia was from Czižek (1910) who introduced 1 species, and Vimmer (1913) recorded a further 2 species. All available data are from the last decade. Nine species of two genera are recently known from Czechoslovakia but a further 4 to 6 species may well be found. Considering the parasitic development of acrocerid larvae in common spiders the occurrence of individual species will surely be more widely distributed on the whole territory than is indicated in the present list.

ASILIDAE

Vladimír STRAKA and Milan HRADSKÝ

The first data in literature that point to the occurrence of the family Asilidae (Diptera) in Czechoslovakia were given in the papers by Schiner (1862), Frivaldszky (1870), Kowarz (1883) and Thalhammer (1899), and these imply the records coming from Austria-Hungary and Silesia. Since the beginning of the century a great many authors dealt with that family. In Bohemia, Moravia and Silesia the family Asilidae was included in the lists by Czižek (1906, 1907, 1908), Landrock (1907, 1908, 1910), and Vimmer (1913). Data about the occurrence of individual species in Slovakia can be found in papers by Bartal (1906), Brancsik (1910) and Fekete (1914). From the latest papers we give those by Moucha et Hradský (1955, 1963), where a sub-family Laphriinae has been dealt with. Further there are the papers by Moucha (1952), Zajonc (1960, 1961), Weinberg (1974) and Straka (1978).

To compile the following list, data given in literature have been critically judged. Collections coming from the National Museum in Prague, from the Slovak National Museum in Bratislava, and from the Faculty of Agriculture in Nitra, and first of all these coming from the authors' collections have been used to make an overview about, revising them. The list gives 101 species from 29 genera. The occurrence of the species *Neomochtherus schineri* Egg., *Dioctria bicincta* Meig., *Dioctria harcyniae* Loew, and *Pogonosoma maroccanum* F., have not been confirmed, and similarly some of the species given recently and in past, because these were implied elsewhere after being re-determined (for instance the species of *Eutolmus mediocris* Beck., according to Zajonc /1961/). The documenting material giving that list consists of 18 000 specimens. The occurrence of another species may be suggested.

THEREVIDAE

Karel Spitzer

The list is based on examination of the main collections and revision of all literary records. The species of *Thereva* Latr. were revised, keyed and published together with notes on taxonomy, distribution and ecology (Lyneborg et Spitzer, 1974). Further investigations of immature stages are necessary. It is very doubtful that more than 30 species of Therevidae will be recorded from Czechoslovak territory (Spitzer, 1978).

Selected literature: Lyneborg L., 1986a: The Palaearctic species of *Pandivirilia* Irwin et Lyneborg, 1981 (Insecta, Diptera, Therevidae). *Steenstrupia*, 12 (5): 85–98. — Lyneborg L., 1986b: The genus *Acrosathe* Irwin et Lyneborg, 1981 in the Old World (Insecta, Diptera, Therevidae). *Steenstrupia*, 12 (6): 101–113. — Lyneborg L. et Spitzer K., 1974: The Czechoslovak species of *Thereva* Latr. (Therevidae, Diptera) with the description of a new species from Hungary and Austria. *Sbor. Jihočes. Muz. Čes. Budějovicích*, Přír. Vědy, 14 (1): 13–42. — Spitzer K., 1978: Současný stav výzkumu čeledi Therevidae [Diptera] v Československu. *Dipt. bohemoslov.*, Bratislava, 1: 319–321.

SCENOPINIDAE

Jan ZUSKA

Very little is known about the distribution of this family in Czechoslovakia, a limited number of published records are scattered in the literature, mostly pre — 1920. The present list summarizes the critically evaluated published records plus the results of the identification of pinned material from various collections; some specimens recorded in the earlier literature were re-examined. Hitherto, three species have been found in Czechoslovakia, and at least two further species may be expected to occur.

Selected literature: Zuska J., 1977: 40. čeleď Zínělkovití — Scenopinidae. In Doskočil J. (ed.), Klíč zvířeny ČSSR, Vol. 5, p. 172. Academia, Praha.

BOMBYLIIDAE

Ivo ZAJONC

The first knowledge about the family Bombyliidae from the territory of Bohemia originates from Preissler (1790, 1793). In the year 1796 the monographic work on this family „*Monographia Bombyliorum Bohemiae*“ was published by Mikán; 13 species are given [11 of them were described as new species] in this work. The further works follow up to the year 1833 [Eiselt, 1833, 1846; Kowarz, 1867, 1883; Fritsch, 1875; Dalla Torre, 1878]. These data have been summarized by Kowarz (1894) which recorded 27 species from Bohemia. The Bombyliidae of Slovakia we find in Thalhammer's compilation in the work „*Fauna Regni Hungariae*“ (Thalhammer, 1899). The findings from Moravian localities are mentioned by Czižek (1906, 1907, 1908, 1915) and Landrock (1907, 1908, 1910). Several localities from Czechoslovakia are recorded in Engel's monograph [Engel, 1932—37] which is the first work making possible the authentic determination of the species of this family. The recent works with a view to the fauna of Slovakia were published by Zajonc (1958—1961), Čepelák (1979—1983), Čepelák et Vlčková (1964), Čepelák et Macúch (1960), Čepelák, Illéš et Ivančo (1969), and Csütörtöky (1980). Kneifl (1972) deals with the faunistics in Bohemian territory. The knowledge of the family Bombyliidae in Czechoslovakia was summarized by Tomaj (1977, unpublished) in his graduate thesis.

EMPIDIDAE

Milan CHVÁLA

The family is presented here in the modern restricted form after Chvála (1983) comprising only five subfamilies of the former unnatural „Empididae“. However, individual subfamilies and genera are still unequally studied in Czechoslovakia and Europe. The subfamily Oreogetoninae needs urgent modern revision, although only a few additional species may be anticipated in Czechoslovakia. Within the Empidinae only the genus *Rhamphomyia* was sufficiently studied by Barták (1981, 1982) who also prepared the present list. The genus *Hilara* was studied by Straka (1975, 1976) but taxonomic revision based on types is needed. The genus *Empis* was intensively studied in the past twenty years in Czechoslovakia but no published data are available and the given list is certainly not complete; the list of the subgenus *Empis* s. str. is partly based on recent studies of O. Syrovátka. The list of Hemerodromiinae and Clinocerinae is based on identifications provided by Prof. F. Vailant (France) and Dr. R. Wagner (GFR). The Brachystomatinae have not yet been found in Czechoslovakia but the occurrence of the Central European *Brachystoma vesiculosum* (Fabr.) is very probable at least in western parts of Czechoslovakia. The present list includes over 300 species but is far from being complete, some taxonomical changes and new findings of further species are certain.

Selected literature: Barták M., 1981: A revision of the *Rhamphomyia albosegmentata*-group (Diptera, Empididae), with descriptions of new species. *Acta Univ. Carol., Biol.*, 1979 [1981]: 361–407. — Barták M., 1982: The Czechoslovak species of *Rhamphomyia* (Diptera, Empididae), with description of a new species from Central Europe. *Acta Univ. Carol., Biol.*, 1980 [1982]: 381–481. — Chvála M., 1977: Revision of the *Empis rustica* Fall. species-group of the subgenus *Leptempis* Coll. in Europe, with the description of a new species (Diptera, Empididae). *Acta ent. bohemoslov.*, 74: 41–55. — Straka V., 1975: Spracovanie rodu *Hilara* Meig. (Diptera, Empididae) na území ČSSR. *Biol. práce*, 21 (5): 1–150. — Straka V., 1976: Description of new European species of the genus *Hilara* Meigen (Diptera, Empididae). *Annot. zool. bot.*, 116: 1–36.

HYBOTIDAE

Milan CHVÁLA

The family Hybotidae undoubtedly represents the best known and revised group of the former „Empididae“. There are modern revisions of the British (Collin, 1961) and Scandinavian (Chvála, 1975, 1983) faunas, but publications on Czechoslovak and Central European species, although thoroughly studied, are still lacking. Scattered revisions of Czechoslovak species have been published on *Tachydromia* (Chvála, 1970), *Tachypeza* (Chvála, 1974) and *Oedalea* (Chvála, 1981). Real progress on the knowledge of the Czechoslovak fauna in recent years may be demonstrated by the genus *Platypalpus*; Zusková revised in 1966 the genus in Czechoslovakia and at that time, 21 years ago, she found out 40 *Platypalpus* species, the present list contains 93 species. However, not even this number is at least definite, as about 15 species of *Platypalpus* found in Czechoslovakia still wait for description and there are a further 3 new species for science of *Bicellaria*. The present list contains 179 species of 21 genera and 3 subfamilies, but the real number of Czechoslovak species of Hybotidae may well be estimated as something like 250 species.

Selected literature: Chvála M., 1970: Revision of Palaearctic species of the genus *Tachydromia* Meig. (= *Tachista* Loew) [Diptera, Empididae]. *Acta ent. Mus. Nat. Pragae*, 38 (1969): 431—540. — Chvála M., 1974: Distribution of the genus *Tachypeza* Meig. [Diptera, Empididae] in Czechoslovakia. *Folia Fac. sci. natur. Univ. Purkyn. Brun.*, 15: 57—61. — Chvála M., 1975: The Tachydromiinae (Dipt. Empididae) of Fennoscandia and Denmark. *Fauna ent. scand.*, 3, 338 pp., Denmark. — Chvála M., 1981: Revision of Central European species of the genus *Oedalea* [Diptera, Empididae]. *Acta ent. bohemoslov.*, 78: 122—139. Collin J. E., 1961: Empididae, in *British Flies*, 6, 782 pp., Oxford, England. — Zusková L., 1966: Czechoslovak species of the genus *Platypalpus* Macquart [Diptera, Empididae]. *Acta faun. ent. Mus. Nat. Pragae*, 11 [113]: 331—372.

MICROPHORIDAE

Milan CHVÁLA

The present list is based on the very recent studies of European species published by the present author. The published data of old lists of Czižek, Landrock and Vimmer were often based on misidentifications, but the given occurrence is verified by new findings. Six species of two genera were found in Czechoslovakia, and the occurrence of *Schistostoma truncatum* (Loew, 1864) (Microphorinae) in Czechoslovakia seems to be very probable.

Selected literature: Chvála M., 1983: The Empidoidea (Diptera) of Fennoscandia and Denmark. II. General Part. The Families Hybotidae, Atelestidae and Microphoridae. *Fauna ent. scand.*, 12: 1—279. Klampenborg, Denmark. — Chvála M., 1986: Revision of Palaearctic Microphoridae (Diptera) 1. Microphor Macq. *Acta ent. bohemoslov.*, 83: 432—454.

DOLICHOPODIDAE

Jiř OLEJNÍČEK

The history of the study of the family on the territory of Czechoslovakia was in part included in the paper by Olejníček & Rozkošný (1974). The family was studied primarily by Kowarz; also papers by Cziřek and Landrock are of importance. All the previous papers had been included in the bibliographies by Rozkošný (1971, 1977) and in the titles cited below. The present list of species was compiled on the base of all the literary data, on majority of museum material and on extensive author's collection. However, the faunistic investigation on the territory is still far from being completed and significant accessions are to be expected. At present 295 species are known from Czechoslovakia; approximately 350 species may be living here.

Selected literature: Olejníček J. et Rozkošný R., 1974: New distributional data on Dolichopodidae (Diptera) in Slovakia. *Biologĳa*, Bratislava, **29**: 369–386. — Olejníček J., 1978: A contribution to the knowledge of the family Dolichopodidae (Diptera) in Moravia (Czechoslovakia). *Dipt. bohemoslov.*, Bratislava, **1**: 193–196. — Olejníček J. et Rozkošný R., 1978: Some species of Dolichopodidae (Diptera) new to the fauna of Czechoslovakia. *Scr. Fac. Sci. natur. Univ. Purkyn. Brun.*, Biol. 1, **8**: 13–22. — Gregor T., 1981: Faunistic records from Czechoslovakia. Diptera. Dolichopodidae. *Acta ent. bohemoslov.*, **78**: 242. — Vaňhara J., 1981: Lowland forest Diptera (Brachycera, Cyclophafa). *Acta sci. natur. Acad. Sci. bohemoslov. Brno*, **15** (ser. n.) (1): 1–32.

ATELESTIDAE

Milan CHVÁLA

The Atelestidae represents the very ancient group of flies separated only recently from the former „Empididae“, very probably sharing a common ancestor with the Cyclorrhapha (Chvála, 1983). Three species of two genera have been found to occur in Czechoslovakia and this number seems to be definite, although the species will probably be more widely distributed on the whole territory. European species have been revised by Chvála (1983).

Selected literature: Chvála M., 1983: The Empidoidea (Diptera) of Fennoscandia and Denmark. II. General Part. The Families Hybotidae, Atelestidae and Microphoridae. *Fauna ent. scand.*, **12**: 1—279. Klampenborg, Denmark.

LONCHOPTERIDAE

Miroslav BARTÁK and Jaromír MALEČEK

The study of the family Lonchopteridae was almost totally neglected in Czechoslovakia practically up to present. The records prior to De Meijere's (1906) monograph including those of Vimmer (1913) and Czižek (1906) are unreliable according to the inadequate taxonomy of the family. Basic papers concerning distribution of central European species are those of Duda (1927) and Czerny (1934), but no locality from Czechoslovakia is mentioned here with the exception of one species. Some other records scattered through literature (e.g. Aczél, 1940) concern five most common species and are all confirmed by recent investigations. The present list is based on the extensive study of Maleček, who collected over 5,000 specimens of the family and found six species in this material, and on the study of Barták, who examined all the accessible materials from both museums and private collections (about 3,000 specimens) and discovered nine species to occur in Czechoslovakia. Thus, all central European species are registered on this territory.

PHORIDAE

Bohuslav MOCEK and Jan ZUSKA

The faunistic research on the Czechoslovak Phoridae has been progressing rather slowly. The scarce published data are contained in general faunistic lists of the Diptera of Czechoslovakia, or in ecological studies. Only a few papers by Schmitz [1928, 1940, 1941], with are devoted exclusively to phorids, contribute reliable records from the territory of Czechoslovakia. The preliminary list of Phoridae from Czechoslovakia has been elaborated by Mocek [1978]. A list of 14 species of the genus *Phora* occurring on the territory of Czechoslovakia published by Mocek [1982]. 36 species from Slovakia were recorded by Moravčík [1980]. The present list is based (1) on the critical summary of literary data, though in most cases the original specimens were not available for revision, and (2) on the identification of some 7 000 specimens from institutional and private collections. It contains 190 species from 22 genera. However, their number is expected to about 350 in the future.

OPETIIDAE AND PLATYPEZIDAE

Jaromír VAŇHARA

In the territory of present Czechoslovakia, the flat-footed flies (Opetiidae and Platypezidae) were studied by Czerny [1930], Czižek (1906, 1908, 1909), Kowarz [1867, 1894], Szilády [1941 a, b], Thalhammer (1899) and Vimmer (1901, 1912, 1913, 1915). Of the contemporary authors, Dušek (1962) gives the morphology of larvae and puparia of one species; Hubáček (1979), Martinek (1973, 1976) and Máca [1976] mentioned the flat-footed flies in their faunistic papers. Vaňhara (1980) put forward the first species survey of these families in Czechoslovakia on the basis of new taxonomic conclusions done in the last few years. This mentioned study (Vaňhara, 1980) and other ones of mine (Vaňhara, 1981 a; 1986) presents occurrence of flat-footed flies in southern Moravia, mainly in lowland forests. A new genus and a new species of the family Platypezidae from Czechoslovakia were also described by Vaňhara (1981 b). Finally, my faunistic papers (Vaňhara, 1981 c; 1982, 1984) present occurrence of flat-footed flies in individual territories of Czechoslovakia.

The families Opetiidae and Platypezidae include altogether about 40 species in Europe [Chandler, in litt.; Vaňhara, 1981 b] and from those 28 species belonging to 12 genera are known from Czechoslovakia. All literary data from Czechoslovakia were confirmed by material under study, except *Polyporivora picta* (Meig.) quoted only by Kowarz (1867) and *P. boletina* (Fall.) quoted by Martinek (1976). The genus *Atelestus* Walk. included sometimes also in flat-footed flies, is pointed out in the new family Atelestidae [Chvála, 1983]. For the genus *Opetia* Meig. there is used the new family Opetiidae put forward by Chvála (1981). *Microsanía collarti* Chandler, in litt. and *Agathomyia woodella* Chandler, in litt., published in some my papers (Vaňhara, 1981 c; 1982) and in check list by Hackman (1980) have at present the status of nomina nuda. These will be new names for *Microsanía stigmatalis* (Zett.) sensu Collart and *Agathomyia elegantula* (Fall.)/*cinerea* (Zett.) sensu Lundbeck in the prepared monograph on the European Platypezidae by P. J. Chandler (England). This authors kindly revised the manuscript of this check list of the Czechoslovakian flat-footed flies.

SYRPHIDAE

Jindra DUŠEK and Pavel LÁSKA

This is one of the most intensively studied families in Czechoslovakia. The first faunistic reports lacking, however, in material and without indication of exact finding places were published by Kowarz (1885, 1894) and Czižek (1906a, 1907, 1908a, 1909b, 1910a). Becker (1894a) described several species of the genus *Cheilisia* from Bohemia and from Slovakia. Vimmer (1912a, 1913a) in his „Seznam československého hmyzu dvoukřídlého“ (List of the Czech dipterous insects) gives detailed localities. After 1950 extensive faunistic research started to be developed by Kempný (1951, 1952, 1953, 1955, 1956, 1957, 1958a, b, 1959, 1961), by Čepelák (1957, 1958, 1962a and 1962b — last two being common with Zajonc) and Stollár (1964, 1972, 1976, 1978). Kempný devoted his attention mostly to the Moravian Silesia, Čepelák and Stollár worked mainly in Slovakia. This information is supplemented by Moucha (1957, 1961), Moucha and Štys (1954), Moucha and van der Goot (1971), Štys (1959), Štys and Moucha (1962) and Bičík (1964). Several species new to the territory of Czechoslovakia were discovered by Ernst Torp and Juraj Čepelák (personal communication), who also gave critical remarks on our manuscript. Some faunistic data could be found in papers dealing with taxonomy, larval stages and ecology as e.g. [Vimmer (1925d, 1927a), Dušek and Láská (1958, 1960, 1962, 1973, 1976, 1982), Doležil and Rozkošný (1967), Láská and Starý (1980) and Kula (1980a, b, 1981, 1983)]. In the present list all the literary data are critically evaluated, since up to this time only part of the museum materials could be revised. In some dubious species a revision of type specimens was made. Therefore the faunistic research appears to be not finished. Many species are documented by only individual or in their areal very limited number of specimens. Especially the genus *Cheilisia*, being richest in species is up to time, insufficiently known obviously due to its habitual uniformity and difficult taxonomy. So far, 378 species are known to occur on the territory of Czechoslovakia. The presumed number of species not yet evidenced may vary between 3—10 % corresponding about 10—40 species.

PIPUNCULIDAE

Pavel LAUTERER and Milan KOZÁNEK

The *Pipunculidae* of Czechoslovakia have received fairly systematic attention in the late 19th and early 20th century. Eight species have been described from this territory (Kowarz, 1887; Aczél, 1939; Aczél, 1944; Kozánek, 1981a; Kozánek, 1981c), two of which appeared to be junior synonyms. Four papers contain description of hitherto unknown opposite sexes, based on materials collected in our region (Kowarz, 1887; Czižek, 1908b; Czižek, 1909a; Lauterer, 1981); two papers contain descriptions of puparia (Ott, 1900; Vimmer, 1926e). The remaining notes are of faunal character. Dalla Torre (1878) is the first to mention members of the family from Bohemia. The foundations of faunal investigations in Bohemia were laid by Kowarz (1887, 1894); his data were supplemented by Becker (1898) and Vimmer (1912a). Becker (1900) was the first to publish data from Moravia, and the foundations of faunal investigations in that region were laid by Czižek (1906a, 1907, 1908a, 1908b, 1909a, 1910a, 1915a, 1925) and by Landrock (1907a, 1907b, 1908, 1910). Part of Czižek's determinations were verified by Becker. The papers by Aczél (1938a, 1939b, 1944) report several species from Slovakia but also from Bohemia and Moravia. After World War II, scattered notes on the occurrence of several species in Bohemia are contained in the papers by Doskočil et Hůrka (1962), Skuhrový, Novák et Starý (1959), Martinek (1960, 1973) and Máca (1976). Based on his own extensive collections, Chvála compiled a preliminary list of the *Pipunculidae* but has not published his results. In addition, he compiled the first Czech key to the genera of this family (Chvála, 1977). Chvála's determinations of the genus *Chalarus* in the insect communities of a lowland forest were evaluated by Vaňhara (1981). Kozánek (1981a, c) elaborated the genus *Pipunculus* in Czechoslovakia from the taxonomic and faunal points of view, elaborated faunistically also the genus *Nephrocerus* (Kozánek, 1981b) and presented a list of species found at Turec (Kozánek, in: Moravčík et Kozánek, 1983). In fauna', bionomic and partly even taxonomic respects, Lauterer (1981) evaluated the genera *Verrallia*, *Nephrocerus*, *Dorylomorpha* and *Tomosvaryella* and published certain data in bionomics (Lauterer, 1983). At present, the investigations on this family are being conducted by the present authors. The collections of these flies are concentrated mostly in the Moravian Museum in Brno and coll. M. Kozánek, less in the Museum in Martin, National Museum in Prague, Silesian Museum in Opava, and in the collections of several private collectors.

The present authors have critically evaluated all available literary data. They confronted the published data with a revision of existing material of only five genera for the time being. A critical revision of the other genera will probably result in further additions and changes in the cited species. In Czechoslovakia, the available data record the occurrence of eight genera (B 8, M 8, S 8) and 63 species (B 34, M 50, S 41). In their manuscripts, the present authors have enlarged the number of species to 73 (B 43, M 66, S 56). Findings in the neighbouring countries suggest that the territory of Czechoslovakia is populated by about 95 species belonging to 9 genera.

The section on the genus *Pipunculus* was elaborated here by M. Kozánek, the remaining parts by P. Lauterer.

CONOPIDAE

Milan CHVÁLA

Although the adults are not common in nature, the family Conopidae belongs among the well-studied and well-known groups of flies in Czechoslovakia, particularly because of its rather easy identification. Thirty four species were recognized from Czechoslovakia already in the old dipterological lists published in the years 1899 to 1913 by Thalhammer, Czižek, Landrock, Brancsik and Vimmer. Modern revisions of Czechoslovak species [Chvála, 1961, 1965] seem to be almost complete as only a few new data are given in the present check-list. Altogether 55 species are recognized recently from Czechoslovakia but the occurrence of a further five or six species may be anticipated in the southern warm regions of the territory.

Selected literature: Čepelák J., 1959: Příspěvek k poznání československých zástupců čeledi ochnatkovitých (Diptera, Conopidae). *Čas. ěsl. PSEUDOPOMYZIDAE

Jindřich ROHÁČEK

A small family containing only one species in the Palaearctic Region; Roháček (1981) recorded it from South East Slovakia.

Selected literature: Roháček J., 1981: First record of the family Pseudopomyzidae (Diptera) from Czechoslovakia. *Čas. Stez. Muz. [A]*, **30**: 189–190.

Pseudopomyza Strobl, 1893
atrimana (Meigen, 1830) S

MICROPEZIDAE

Jan ZUSKA

No comprehensive study of the Micropezidae of Czechoslovakia has been published, the only records available being those in general faunistic papers on Diptera. The present list is based on critically evaluated published records, and on the identification of numerous individuals in various private and institutional collections, including most of the specimens mentioned in the older faunistic literature. No special effort has been made to collect material evenly over the territory. Altogether 9 species are listed here; 4 additional species will probably be collected in the future.

Selected literature: Doskočil J., 1977: 50. čeleď Štíhlonožkovití — Micropezidae. In Doskočil J. (ed.), Klíč zvířeny ČSSR, Vol. 5, p. 220—221. Academia, Praha.

TANYPEZIDAE

Vladislav MARTINEK

The list is based partly on already published data for Bohemia by Kowarz [1894], Vimmer [1913], Martinek [1967] and Cole [1981], for Moravia by Czižek [1910], Martinek [1979] and Vaňhara [1981] and for Slovakia by Soós [1946], partly on not yet published collections of the author from Bohemia.

Selected literature: Cole J. H., 1981: *Strongylophthalmyia ustulata* [Zetterstedt] (Diptera: Tanypezidae) new to Britain. *Ent. Gaz.*, **32**: 47–50. — Martinek V., 1967: Neue Erkenntnisse über Verbreitung einiger zoogeographisch interessanten Arten der Dipterenfamilien Helomyzidae, Psilidae und Otitidae in Böhmen und Mähren. PSILIDAE

Vladislav MARTINEK

The list is based on the developed systematic and faunistic research of the Czechoslovak territory. The family has not been studied in detail on the Czechoslovak territory up to recent times. The occurrence of some species have been recorded, for instance, by Dalla Torre (1878), Kowarz [1883, 1894], Thalhammer (1899), Vimmer (1906, 1907—1908, 1913), Bartal (1906), Czižek (1906, 1907, 1908, 1910), Landrock (1907a, b, 1908, 1910), Branczik (1910), Fekete (1914), Slavíček (1930), Soós (1946, 1980), Doskočil (1962, 1973), Máca (1976), Vaňhara (1981, 1983), Roháček et Zuska (1983) and in numerous contributions of Martinek (1967, 1971, 1972, 1973, 1974a, b, 1975, 1977, 1980a, b, 1982, 1984a—c, 1985). The author started the compilation of the list of Czechoslovak species mostly from his own findings, from the results of the determination of collections of some private collectors and mainly from the results of the revision of all collections of the main Czechoslovak museums (cf. Martinek 1976, 1979, 1984d). Nearly all published data were confirmed by the revision of the preserved documentary material and critically judged. Genera in the list are classified alphabetically. In Czechoslovakia there are 36 species of this family in five genera. The published data on one other species could not be confirmed at the present time as the documentary specimen was not available at the revision. On the territory there may also occur three other described species of this family, and perhaps 1—2 species may be newly described from this region.

DRYOMYZIDAE

Vladislav MARTINEK

The list is based on personal collections of the author. Materials of this family from the main Czechoslovak museums were mostly revised and partly already published (Martinek 1976, 1980, 1984d), the findings of the author included. Findings of species in the ČSSR were made, for instance, by Kowarz [1894], Thalhammer [1899], Czižek [1906, 1916], Landrock [1907], Branczik [1910], Fekete [1914], Vimmer [1913], Slavíček [1930], Soós [1941], Máca [1976], Vaňhara [1981] and further by Martinek (1971, 1973—1975, 1984a—c). In the territory there occur frequently three species of one genus of the given family.

SCIOMYZIDAE

Rudolf ROZKOŠNÝ

A consecutive revision of the Scioomyzidae deposited in the collections of Czechoslovak institutions (Rozkošný, 1961, 1962a, 1965a) and a rather extensive faunistic investigation (Doskočil, 1962; Rozkošný, 1959a, b, 1962b, 1963, 1965b) led into a monograph of Czechoslovak species (Rozkošný, 1966). Further distribution records published more recently (Doskočil, 1973; Martinek, 1971, 1973—1985; Máca, 1977; Rozkošný, 1978, 1985; Roháček et Zuska, 1983) enlarged considerably the present knowledge on the distribution of Czechoslovak species. Although the territory of Czechoslovakia and especially of Slovakia was investigated almost systematically, some additional species new to our fauna may be discovered. The taxonomic state and the synonymy of most European species appear to be well-elucidated now though the comprehensive revision of all the taxa is still not completed.

MEGAMERINIDAE

Vladislav MARTINEK

The list is based on the occurrence of only one sporadic species which was published already by Weinfurter (1907), Vimmer (1913), Soós (1946), Martinek (1979) and most recently by Vaňhara (1981). Other specimens found in Bohemia and Moravia have not been published.

Selected literature: Martinek V., 1979: Druhy čeledí Psilidae a Megamerinidae (Diptera), zastoupené ve sbírkách Moravského muzea v Brně. *Acta Mus. Mor. loxocerina (Fallén, 1820)

SEPSIDAE

Jan ZUSKA

No systematic survey of the distribution of Sepsidae in Czechoslovakia has been made. The following list is mainly based on a revision of a rather extensive material from institutional and private collections identified by the author. To a large extent, available data have already been published [Zuska, 1960; Zuska et Laštovka, 1969; Roháček et Zuska, 1983]. The records in older literature [published prior to 1925] have mostly been disregarded, unless confirmed by the revision of the appropriate original material, or by re-capture of the species. Some four additional species can be expected to be found in the future; at present 26 species are known from Czechoslovakia.

Selected literature: Roháček J. et Zuska J., 1983: Diptera Acalyptrata rašelinišť severní Moravy (ČSSR). Část 3. Micropezidae, Psilidae, Sciomyzidae, Sepsidae. *Čas. Slez. Muz.* [A], 32: 1–22. — Zuska J., 1960: Beitrag zur Kenntnis der Systematik, Faunistik und Ökologie der tschechoslowakischen Arten der Familie Sepsidae [Diptera]. *Acta Soc. ent. čechoslov.*, 57: 21–30. — Zuska J. et Laštovka P., 1969: Species-composition of the dipterous fauna in various types of food-processing plants in Czechoslovakia. *Acta ent. bohemoslov.*, 66: 201–221.

OTITIDAE

Vladislav MARTINEK

The list is based on the developed faunistic research of the Czechoslovak territory. The family was not studied in Czechoslovakia up to recent years in detail. Findings of some species were published up to now, for instance, by Moczárý [1877], Dalla Torre [1878], Kowarz [1883, 1894], Thalhammer [1899], Bartal [1906], Vimmer [1906, 1913], Czižek [1906, 1907, 1908, 1910], Landrock [1907a, b; 1908, 1910], Branczik [1910], Fekete [1914], Slavíček [1930], Soós [1957], Máca [1976], Vaňhara [1981] and in some faunistic contributions even by Martinek [1967, 1971, 1973—1975, 1980, 1984a—c]. The list of species is based on the revision of the material in the main Czechoslovak museums (cf. Martinek 1976, 1978, 1984d), on the author's material and results of the collections of some other collectors. Nearly all published data were confirmed by the results of the revision of the preserved documentary material and critically judged. Genera are in the list classified in alphabetical order. Czechoslovakia has 26 species of the given family, in total nine genera. About five other described species of this family may be yet be discovered on the territory, penetrating this region from Mediterranean or from the Black Sea region.

ULIDIIDAE

Jan ZUSKA

Distributional records from the territory of Czechoslovakia are scattered in many papers, e.g. Vimmer (1913), Soós (1941), Martinek (1975) etc. A faunistic review was published by Zuska (1967) including the results of a partial revision of the material mentioned in older literature. A thorough study of the distribution of the Ulidiidae in Czechoslovakia still remains to be done. Only three species are known to occur here, although a further one or two species may be expected.

Selected literature: Zuska J., 1967: The Czechoslovak species of Ulidiidae (Diptera, Acalyptrata). *Acta faun. ent. Mus. Nat. Pragae*, **12**: 201–205. — Martinek V., 1975: Nálezy některých dvoukřídlých (Diptera-Acalyptrata) v západních a jihozápadních Čechách. *Zprávy muz. Zápaďočes. kraje, Příroda*, Plzeň, **18**: 21–30.

PLATYSTOMATIDAE

Vladislav MARTINEK

The list is based on the survey of personal collections of the author and on the revision of a part of the material in the main Czechoslovak museums [cf. Martinek 1976, 1984 c]. Findings of some species of this family in Czechoslovakia were published, for instance, by Kowarz [1894], Thalhammer [1899], Bartal [1906], Czižek [1906], Landrock [1907], Branczik [1910], Vimmer [1913], Slavíček [1930], Soós [1958], Doskočil [1962], Máca [1976], Vaňhara (1981) and further by Martinek [1973, 1974, 1982, 1984 a, b]. On the territory of the ČSSR the findings to the present time include six species of this family in two genera. In southern Slovakia and southern Moravia a further 1–2 warm-loving species may penetrate the territory from south and east.

TEPHRITIDAE (TRYPETIDAE)

Jan DIRLBEK, Karel DIRLBEK and Olga DIRLBEKOVÁ

A list of Czechoslovak fruit flies (Tephritidae) was compiled on the basis of specimens concentrated in Czechoslovak museums. The data about the fruit flies on the territory of Czechoslovakia are presented in the studies: Aczél [1937 and 1940c], Bobek (1890), Brancsik (1910), Czižek [1906, 1907, 1908 and 1910], Dirlbek J. et Dirlbek K. (1959, 1970 and 1971), Dirlbek K. et Dirlbek J. (1959a, b, 1960 and 1970, Dirlbek J. et Dirlbeková O. [1974], Dirlbeková O. et Dirlbek J. [1970], Fekete [1914], Frauenfeld [1865], Kolenati (1862), Kowarz (1894), Landrock [1907 and 1910], Loew (1871), Nowicki (1867), Pax [1921], Schiner [1858 and 1862], Strobl (1894), Thalhammer (1899), Vimmer [1913]. Gall-forming species of fruit flies are registered by Baudyš E. and Bayer E. (Baudyš, 1954; Bayer, 1914 and 1920); leaf-mining species by Kvičala [1938], Starý (1930), Vimmer [1931], Zavřel (1953, 1955, 1956a and 1960). The descriptions of larvae and pupae are presented in the papers of the authors: Dirlbek K. et Dirlbek J. (1962), Vimmer (1925); larvae, pupae and eggs: Dirlbek J. (1970); the bionomic data are described by Vimmer (1925), Dirlbek K. et Dirlbek J. (1959 and 1960), Dirlbek J. et Dirlbek K. (1959), Dirlbeková O. et Dirlbek J. (1970); taxonomic data: Vimmer (1931), Dirlbek J. et Dirlbeková O. [1974], Dirlbek K. et Doskočil J. (1977). In the region of Czechoslovakia there are 106 species of fruit flies.

PALLOPTERIDAE

Vladislav MARTINEK

The list is based on the developed systematic and faunistic research in recent times. Findings of some species of this family on Czechoslovak territory have been published, for instance, by Kowarz [1883, 1894], Thalhammer [1899], Czižek [1908, 1910], Landrock [1908], Branczik [1910], Vimmer [1913], Slaviček [1930], Doskočil [1962], most recently by Martinek [1971, 1973—1976, 1978, 1980, 1982, 1984 a—d], Vaňhara [1981], Soós [1980] and by Dirlbek et Roháček [1983]. The monograph of this family published by the author [1977] is based on his own findings and on specimens of other collectors, but mainly on revision of all the available material in Czechoslovak museums. In the territory of Czechoslovakia live 14 species of two genera of this family.

NEOTTIOPHILIDAE

Vladislav MARTINEK

The list is based on the revision of the material in some Czechoslovak museums (Martinek, 1978) and on personal findings of the author. Findings of specimens of this family on Czechoslovak territory were recorded, for instance, by Soós (1941), Doskočil (1960) and Martinek (1976, 1984). In Czechoslovakia there are two species from two genera of the family.

Selected literature: Doskočil J., 1960: Nález *Neottiophilum praeustum* v Čechách. *Acta Soc. ent. čechoslov.*, 57(2): 193—194. — Martinek V., 1976: Zajímavější druhy dvoukřídých (Diptera), především skupiny Acalyptrata, na území Slovenské socialistické republiky. *Ent. PIOPHILIDAE

Jan ZUSKA

The Czechoslovak fauna of the family Piophilidae is well known. Zúska et Laštovka (1965, 1969) published a number of records from Czechoslovakia. The former paper, on which the present list is mainly based, also includes results of the re-examination of specimens mentioned in older literature. The records available are rather evenly distributed over the territory, though additional data would be useful. At present ten species are known from Czechoslovakia, and one more species may be expected to occur here.

Selected literature: Zúska J. et Laštovka P., 1965: A review of the Czechoslovak species of the family Piophilidae with special reference to their importance to food industry (Diptera, Acalyptrata). *Acta ent. bohemoslov.*, **62**: 141—157. — Zúska J. et Laštovka P., 1969: Species-composition of the dipterous fauna in various types of food-processing plants in Czechoslovakia. *Acta ent. bohemoslov.*, **66**: 201—221.

THYREOPHORIDAE

Jindřich ROHÁČEK

This small family (now considered a mere subtribe of Piophilidae) contains only two monotypic genera in the Palaearctic Region. Both species became probably extinct in Europe but *Centrophlebomyia furcata* has recently been rediscovered in Israel. There is only one record of the latter species from Bohemia [Schiner, 1864; repeated by Vimmer, 1931a]; the other European species, *Thyreophora cynophila* (Panzer, 1798), has never been collected in Czechoslovakia.

Selected literature: Doskočil J., 1977: Thyreophoridae. In Doskočil J. (ed.), Klíč zvířeny ČSSR, Vol. 5, p. 246. Academia, Praha.

Centrophlebomyia Hendel, 1903*Thyreolepida* Sack, 1939*furcata* (Fabricius, 1794) B*cinerea* (Sack, 1939)

LONCHAEIDAE

J. Frank McALPINE, Jan MÁČA and Jan ZUSKA

Lonchaeidae of Czechoslovakia were only sparsely recorded in the monographs bearing upon this family (Czerny, 1934; Collin, 1953; Kovalev, 1981; McAlpine et Morge, 1970; Morge, 1959, 1962). Additional notes are scattered in papers dealing with forest entomology or faunistics of Diptera; many of the older notes have been confirmed by revisions of pertinent material or, more often, by recent collections of the same species in particular countries. Two partial faunistic surveys have been prepared recently (Máča, 1986 a, b). Many of the identifications of species were provided by J. F. McAlpine, a number of species were determined by G. Morge (which is greatly appreciated) or J. Máča. J. Zuska gathered valuable material of various collections and made most of the organization work.

Up to now, 41 species have been discovered in Czechoslovakia. Approximately 15–20 species will be probably added to the list in the future.

LAUXANIIDAE

Vladislav MARTINEK

The list is based on the developed systematic and faunistic research of the Czechoslovak territory. The distribution of the species of this family has not been systematically investigated up to recent years in Czechoslovakia. The occurrence of some species in the territory was recorded by older authors, for instance, by Moczáry (1877), Dalla Torre (1878), Kowarz (1883, 1894), Thalhammer (1899), Vimmer (1901, 1904, 1906, 1913, 1920), Bartal (1906), Landrock (1907a, b, 1908, 1910), Czižek (1906, 1907, 1908, 1910, 1925), Branczik (1910), Fekete (1914) and later Slavíček (1930), Szilády (1941), Papp (1978, 1979), Remm (1979). Recent list of species of this family from Moravia was compiled yet by Doskočil (1962) and Vaňhara (1981) and the latest records from various regions of Bohemia are given by Máca (1976) and mainly by Martinek (1971—1975, 1977a, 1980, 1982, 1984a—c). The author started the compilation of the list of species mainly from personal findings and from results of the determination of private collections of numerous collectors, but the basis were also results of the revision of collections in Czechoslovak museums (cf. Martinek 1976, 1977b, 1984d). Nearly all published data were confirmed by results of the revision of the preserved documentary material and were critically judged. Genera in the list are classified alphabetically. In Czechoslovakia there live 72 species of this family in total 15 genera. Published data about the occurrence of a further two species could not be approved, as the preserved documentary material was not available at the revision. In the territory of this country there may also occur about eight other described species of the family, mostly southern or very rare species. 1—2 species may be also newly described from the territory.

CHAMAEMYIIDAE

Vlastimil LAPÁČEK

No special study is devoted to the presence of the family Chamaemyiidae in ČSSR. Some notices are possible to be found in the papers of a faunistic or catalogue character (Czižek, 1906, 1907, 1910, 1915; Kowarz, 1894; Landrock, 1908, 1910; Thalhammer, 1899; Vimmer, 1913, 1927, 1931). The family Chamaemyiidae is studied more carefully because of the importance of the family in biological control. In spite of this the papers of a faunistic character are more common especially in ČSSR (Doskočil, 1973; Doskočil et Hůrka, 1962; Dušek et Křístek, 1959; Martinek, 1976). It is possible to find some notices about the distribution of the members of the family Chamaemyiidae in the papers of foreign entomologists (McAlpine, 1971).

The list is based on the literary data (only partially revised) and on the material in the author's collection. There is insufficient data for the genus *Leucopis*, which surely contains more species in ČSSR than listed here.

CREMIFANIIDAE

Jan MÁČA

By now, Cremifaniidae have been collected in Czechoslovakia only during the research of predators of the genus *Dreyfusia* Börner (Aphidoidea, Adelgidae), performed by the research workers of the Research Institute of Forestry Management, Zvolen. Their collecting results have been mentioned by Pschorn-Walcher et Zwölfer (1960); except of Czechoslovakia, the only Palaearctic species of Cremifaniidae occurs also in following European countries: Austria, Switzerland, Fed. Rep. Germany and Sweden (op. cit.).

Selected literature: Pschorn-Walcher H. et Zwölfer H., 1960; Further observations on European *Dreyfusia* (Adelges-) Populations. *Z. angew. Ent.*, **46**: 260—273.

Cremifania Czerny, 1904
nigrocellulata Czerny, 1904 S

CURTONOTIDAE

Vladislav MARTINEK

The list is based on personal collections of the author. The data on the occurrence of sporadically occurring species in Moravia were published by Martinek (1982) and in Slovakia by Branczik (1910) and Soós (1946).

Selected literature: Soós Á., 1946: Die acalypteren Musciden des Karpatenbeckens. III. *Fragm. faun. hung.*, 9(1-4): 2-10. — Martinek V., 1982: Discovery of some new species of Diptera-Acalyptrata in the fauna of Czechoslovakia. *Folia Fac. sci. natur. Univ. Purkyn. Brun.*, Biol. 74, 23(7): 75-81.

DROSOPHILIDAE

Petr LAŠTOVKA and Jan MÁČA

Most of the faunistic records of Czechoslovak Drosophilidae have been scattered either in the faunistic lists of wider extent, or in the phytopatological papers on mining larvae (*Scaptomyza* spp.) or in various synecological contributions. Only a few papers — all of them from the post-war period — may be held for important sources of faunistic information. Aradi (1959) compiled faunistic records of the family from Slovakia. Martinek (e.g. 1971) published results of his collections in some regions of Czechoslovakia. The genera *Scaptomyza* and *Amiota* were revised by Máča [1972, 1977, 1980a], the *Drosophila* subgenus *Lordiphosa* and the genus *Stegana* were revised by Laštovka et Máča (1978, 1982). Faunistic knowledge of Czechoslovak Drosophilidae was complemented by Máča (1980b, 1982) and Máča et Laštovka (1985 and 1986). All preserved material corresponding to previously published papers have been studied by the authors of this list. 69 species belonging to 11 genera are given from the territory of Czechoslovakia. The actual number of Czechoslovak species is probably between 70 and 75.

CAMILLIDAE

Jan MÁČA

Of the sparse published records from Czechoslovakia, only those of Basden (1916), Doskočil (1962) and Máča (1981) conform to modern taxonomic views. Some of the preserved materials were redetermined and new data, documented by the author's own collections, were included in the list of species. 4 species of *Camilla* were found from Czechoslovakia; it is probable that not more than actually 5 species occur.

Selected literature: Basden E. B., 1916: Notes on Camillidae (Diptera) in Strobl's collection and on the biology of *Camilla*. *Notul. ent.*, **41**: 124—129. — Doskočil J., 1962: Dvoukřídlí (skupiny Acalyptrata) Rychlebských hor. *Přírodov. Čas. slez.* **23**: 249—272. — Máča J., 1981: Faunistic records from Czechoslovakia. *Camilla atrimana*, *C. glabrata*, *Odinia loewi*, *O. boletina*. *Acta ent. bohemoslov.*, **78**: 302.

DIASTATIDAE

Jan MÁČA

There are only a few records of this family from Czechoslovakia, most of them being quite recent [e.g. Basden et Collin, 1958; Doskočil, 1962; Máča, 1976 and 1986; Martinek, 1971; Roháček et Máča, 1982]. For the purpose of the present list, some of the preserved materials were redetermined and the other data were documented by the author's own collections. Taxonomic concepts of Griffiths (1972) and nomenclatural changes proposed by him are not adopted here, in concordance with other authors, e.g. Hackman (1980). 8 species are known from Czechoslovakia, but the actual number of Czechoslovak species should be estimated to about 10.

Selected literature: Basden E. B. et Collin J. E., 1958: On the examination of some Meigen and Zetterstedt specimens of *Campichoeta* Macquart (Diptera: Diastatidae). *Proc. R. ent. Soc. Lond. (B)*, **27**: 133–144. — Doskočil J., 1962: Dvoukřídli (skupiny Acalyptrata) Rychlebských hor. *Přírodov. Čas. slez.*, **23**: 249–272. — Griffiths G. C. EPHYDRIDAE

Helena KARNECKÁ

Our knowledge of the distribution of Ephydriidae in Czechoslovakia is relatively poor. Faunistic records are mostly from the beginning of the 20th century, and only about 50 species of Ephydriidae were known from Bohemia, Moravia and Slovakia [Vimmer, 1913, 1915; Landrock, 1907, 1908; Czižek, 1906—1908, 1910]. About ten years ago we started to study Ephydriids more seriously but the determination of many species is relatively difficult. A number of unsolved taxonomic questions are left open. New records came from Slovakia [Martinek, 1976] and Bohemia [Pešková, 1978; Karnecká, 1980].

The present list is based on the personal material of the author and on the published data from literature. In the investigated region there were discovered 34 genera and 92 species. Faunistic investigations continue. The author anticipates that further species will be discovered, especially in Moravia and Slovakia.

Selected literature: Karnecká H., 1980: Shore flies (Diptera Ephydriidae) new to the fauna of Czechoslovakia. *Acta ent. bohemoslov.*, **77**: 419—423. — Karnecká H., 1985: A review of species of *Hydrellia* (Rob.-Desv.) found in Bohemia (Diptera, Ephydriidae). *Acta ent. bohemoslov.*, **82**: 315—319. — Martinek V., 1976: Zajímavější druhy dvoukřídlých (Diptera), především skupiny Acalyptrata, na území Slovenské socialistické republiky. *Ent. Probl.*, **13**: 89—105. — Papp L., 1975: Vizilgyek — Ephydriidae. *Fauna Hungariae*, **120**: 1—128. — Pešková H., 1978: Ephydriidae (Diptera) from different meadow communities. *Dipt. bohemoslov.*, Bratislava, **1**: 205—228.

AGROMYZIDAE

Miloslav VÁLA

The level of the faunistic knowledge of Agromyzidae in Czechoslovakia is rather poor. The previous students directed their attention to the host plants and types of mines. The family is taxonomically a very difficult group so that from this point of view these two criteria are insufficient. Publications dealing with Agromyzidae are based on the keys published by Hering [1927, 1937, 1957]. As any revision of the material of former authors was not made therefore the present list is based on my own material except for: types of the species being described by B. Starý and the ones which are reported by Nowakowski [see selected literature]. The new species for B, M, S are indicated in the case if no data about these species appeared in literature [all information was taken in to account]. The present list is a beginning of the faunistic study on the family Agromyzidae in our country.

Selected literature: Griffiths G. C. D., 1963: A revision of the Palaearctic species of the nigripes group of the genus *Agromyza* Fallén (Diptera, Agromyzidae). *Tijdschr. Ent.*, **106**: 113—168. — Nowakowski J. T., 1964: Studien über Minierfliegen (Diptera, Agromyzidae), 9. Revision der Artengruppe *Agromyza reptans* Fall., *Agromyza rufipes* Meig. *Dt. ent. Z.*, **11**: 175—213. — Nowakowski J. T., 1973: Monographie der europäischen Arten der Gattung *Cerodontha* Rond. (Diptera, Agromyzidae). *Ann. zool.*, **31**: 1—327. — Vaňhara J., 1981: Lowland forest Diptera (Brachycera, Cyclorrhapha). *Acta sci. natur. Acad. Sci. bohemoslov.*, **15** [ser. n.] [1]: 1—32. — Vála M., 1981: Faunistic records from Czechoslovakia (Diptera, Agromyzidae). *Acta ent. bohemoslov.*, **78**: 253. — Vála M. et Roháček J., 1983: Acalyptrate Diptera of peat-bogs in North Moravia [Czechoslovakia]. Part 5. *Agromyzidae*. *Čas. Slez. Muz. (A)*, **32**: 193—214.

CLUSIIDAE

Jan ZUSKA

No special study of the Clusiidae of Czechoslovakia is available, but Handlirsch (1885), Czerny (1903) and Soós (1943) contributed some data. The list presented below is based on critically selected published records and on a limited number of examined specimens, mainly from private collections. More research is badly needed. At present six species are known from Czechoslovakia, and at least three additional species may be found in the future.

Selected literature: Zuska J., 1977: 73. Čeleď Různořádkovité — Clusiidae. In Doskočil J. (ed.), Klíč zvířeny ČSSR, Vol. 5, p. 253. Academia, Praha.

<i>beckeri</i> Czerny, 1903	*M

ODINIIDAE

Jan MÁČA

Apart from three unverified records, only a few papers (Collin, 1952; Máča, 1978, 1980 and 1986; Papp, 1978) mentioned members of this family from Czechoslovak territory. The papers are based on revisions of old collections and-or on the evaluation of material collected by the authors. 7 species (in two genera) are stated from Czechoslovakia, but through intensive faunistic survey this number may be increased to about 10.

Selected literature: Collin J. E., 1952: On the European species of the genus *Odinia* R.-D. (Diptera: Odiniidae). *Proc. R. ent. Soc. Lond. (B)*, **21**: 110–116. — Máča J., 1978: Czechoslovak species of the family Odiniidae. *Dipt. bohemoslov.*, Bratislava, **1**: 147 to 153. — Máča J., 1984: Faunistic records from Czechoslovakia. *Camilla atrimana*, *C. glabrata*, *Odinia loewi*, *O. boletina*. *Acta ent. bohemoslov.*, **78**: 302. — Máča J., 1986: Čelad: Odiniidae. In Čepelák J. [ed.], *Diptera Slovenska* 2, p. 176. Veda, Bratislava. — Papp L., 1978: Odiniidae — Taplólegyek. *Fauna Hungariae*, **133**: 1–9.

HELEOMYZIDAE

Vladislav MARTINEK

The list is based on the developed, nearly finished systematic and faunistic research of the Czechoslovak territory. The family has not been systematically studied in the Czechoslovakia until recent years. The occurrence of some species in the territory is recorded by older authors, for instance, by Dalla Torre (1878), Kowarz (1883, 1894), Thalhammer (1899), Bartal (1906), Vimmer (1906, 1911, 1913), Czižek (1906, 1908, 1910, 1916, 1925), Landrock (1907a, b, 1908, 1910), Branczik (1910), Fekete (1914), Czerny (1924), Szondy (1929), Pax et Maschke (1935), Pax (1937), later Perutík (1956), Doskočil (1962, 1973), Máca (1976), Papp (1981) and Vaňhara (1981, 1983). The most complete lists of species of this family from various regions of country were compiled by Martinek (1967, 1969, 1971—1976a, 1977a, 1980, 1982, 1984a—c, 1985). The basis of his material was his own findings, partly also collections of private collectors, but also results of the revision of the preserved material in the main Czechoslovak museums (cf. Martinek 1976b, 1977b, 1984d). All published data were confirmed by the results of revision of the preserved documentary material and were critically evaluated. Genera in the list are classified in alphabetical order. In Czechoslovakia there live 83 species of this family in 15 genera altogether. In the territory about 5 other species of this family may occur, probably very rare or rarely penetrating from southern or south western Europe. 1—2 other species may be yet newly described.

TRIXOSCELIDIDAE

Vladislav MARTINEK

The list is based on personal findings of the author and on the results of the revision of material in the main Czechoslovak museums (cf. Martinek 1976, 1980a). Findings of some species of this family in Czechoslovakia were published, for instance, by Czižek (1908), Soós (1946), Martinek (1980b, 1984) and Vaňhara (1981). The distribution of species in the territory is still insufficiently known. In the ČSSR there is known in total four species of one genus. The occurrence of a further one to two described species, for instance, of South European ones, is possible.

CHYROMYIDAE

Vladislav MARTINEK

The list is based on the revision of personal material of the author carried out kindly by Dr. H. Andersson [1976], Sweden. Findings of some species of this family in Czechoslovak territory were published, for instance, by Thalhammer [1899], Vimmer [1913], Czižek [1916], Soós [1943], Martinek [1973, 1980, 1984] and recently also by Máca [1976]. In the territory of the ČSSR four species of this family are represented. In the region of Slovakia also one another species may be found. The distribution of single species in the ČSSR is still insufficiently known.

Selected literature: Andersson H., 1976: *Chyromya miladae* n. sp. from Czechoslovakia (Diptera: Chyromyidae). *Ent. scand.*, 7: 187–189. — Máca J., 1976: Příspěvek k poznání dvoukřídlého hmyzu (Diptera) jižních Čech. *Sbor. SPHAEROCERIDAE

Jindřich ROHÁČEK

Little attention was paid to this family in Czechoslovakia up to 1970's; among the numerous faunistic data scattered in older literature (cf. Roháček, 1978b) the most valuable are those of Kowarz (1894), Czižek (1916, 1925) and Zuska et Laštovka (1969). Roháček (1978b) published the first critical list of Sphaeroceridae of Czechoslovakia recording 109 species (26 for the first time) from this country. Further taxonomic and faunistic investigations including the very recent revisionary studies on European Limosininae (Roháček, 1982a, b, 1983a) during which over 35,000 specimens were examined resulted in the discovery of 15 new species (Roháček, 1975a—1978a, 1982a, 1983a) and numerous new records (see also Roháček, 1983b, 1984) from the territory of ČSSR, this increasing the number of species to 140 in the present list. This great number indicates a very high level of the present-day faunistic scanning in Czechoslovakia, one of the best in the World. About 150 species can be expected to occur in our country with certainty without considering the possibility of finding further undescribed taxa. The generic arrangement of the Limosininae in this list follows Roháček's (1982b—1983a) re-classification of the *Limosina*-complex.

Selected literature: Roháček J., 1975a: *Leptocera* (*Opacifrons*) *moravica* sp. n. from Czechoslovakia [Diptera, Sphaeroceridae]. *Acta ent. bohemoslov.*, **72**: 262—265. — Roháček J., 1975b: Three new species of the genus *Limosina* Macq. OPOMYZIDAE

Vladislav MARTINEK

The list is based on the developed systematic and faunistic research of Czechoslovak territory. This family was not studied in detail until recently. Findings of some species were published e.g. by Kowarż [1894], Thalhammer [1899], Czižek [1906], Landrock [1907], Branczik [1910], Vimmer [1913], Fekete [1914], Soós [1943, 1981], Doskočil [1962], Máca [1976], and in some contributions even by Martinek [1971, 1973—1976a, 1979], Roháček [1982] and Vaňhara [1981, 1983], etc. The author used, in the compilation of the list of species, mainly his own collections (cf. Martinek 1978a, b, 1980a, 1982, 1984a—c, 1985) and results of the revision of the collections of the main Czechoslovak museums (cf. Martinek 1976b, 1980b, 1984d). Nearly all published data from Czechoslovak territory were confirmed by the results of the revision of the preserved documentary material and were critically judged. In Czechoslovakia there live 20 species of this family in two genera. The data about one published species could not be attested at the revision of the preserved material by the pertaining specimen. Two-three other described species may occur on the territory.

ANTHOMYZIDAE

Jindřich ROHÁČEK

In the dipterofaunistic research of Czechoslovakia this family belonged to groups neglected almost up to the present. Previous records, scattered in 18 papers, are often of only historical value but some of them are faunistically rather important (e.g. Soós, 1946; Doskočil, 1962). Quite recently, Roháček (1983) revised most of the available material deposited in museums and private collections and critically evaluated published faunistic data. The present list emanates from the latter paper (Roháček, 1983) and additional, recently collected, material. About 2,000 specimens examined formed the material basis for the recognition of 15 species in Czechoslovakia; at most 5 additional species can be expected to occur in this territory. Some taxonomical confusion involved in Roháček (1983) were later improved by revision of type material of certain species (Roháček, 1984). The generic system of the family is yet to be resolved and therefore a traditional concept is followed.

AULACIGASTRIDAE

Jan MÁČA

The single Palearctic species of this family was reported from Czechoslovakia by Soós [1946] and Máča [1976, 1981]. Presented data are based upon the author's own material.

Selected literature: Máča J., 1976: Příspěvek k poznání dvoukřídlého hmyzu (Diptera) jižních Čech. *Sbor. Jihočes. Muz. Čes. Budějovicích, Přír. Vědy*, **16**: 103–140. — Máča J., 1981: Faunistic records from Czechoslovakia. *Aulacigaster leucopeza*, *Periscelis annulipes*. *Acta ent. bohemoslov.*, **78**: 347. — Soós A., 1946: Die acalypteren Musciden des Karpatenbeckens, III. *Fragm. faun. hung.*, **9**: 2–10.

STENOMICRIDAE

Jindřich ROHÁČEK

This lately erected family includes a single genus *Stenomicro* with about 15, predominantly tropical, species. Only two species are known from Europe; one of them has also been recorded from Czechoslovakia (Papp, 1978; Roháček, 1983). The second European species, viz *Stenomicro* (*s. str.*) *cogani* Irwin, 1982, may also be expected in our territory.

Selected literature: Papp L., 1978: Bizonytalan helyzetű torpikkelynélküli légymek. *Fauna Hungariae*, **133**: 195–202. — Roháček J., 1983: Faunistics of the Czechoslovakian species of Anthomyzidae and Stenomicroidae (Diptera). *Čas. Sléz. Muz. (A)*, **32**: 125–135.

Diadelops Collin, 1944
delicata (Collin, 1944) S

PERISCOLIDIDAE

Jan MÁČA

For the first time, Periscelididae were recorded from the territory of Czechoslovakia by Vimmer (1913); two notes by Máča (1981 and 1986) complemented the present check-list. All available Czechoslovak material has been studied; it is deposited in National Museum, Prague, Slezské muzeum, Opava and District Museum, Soběslav. Only 2 species of this family were stated, although 1—2 more species may be expected.

Selected literature: Máča J., 1981: Faunistic records from Czechoslovakia. *Aulacigaster leucopeza*, *Periscelis annulipes*. *Acta ent. bohemoslov.*, **78**: 347. — Máča J., 1986: Čelad: Periscelididae. In Čepelák J. (ed.), *Diptera Slovenska* 2, p. 121, Veda, Brádslava.

<i>annulipes</i> Loew, 1858	B	

ASTEIIDAE

Jindřich ROHÁČEK

There are only scarce previous records of Asteiidae from Czechoslovakia (Brančsik, 1910; Vimmer, 1913; Duda, 1927, 1934; Soós, 1944; Papp, 1973; Máca, 1976). To elaborate this list, the majority of the documentary material in our museums and private collections had been revised (about 500 specimens) and some results from this revision has already been published (Roháček, 1980). Seven species of 2 genera were found in Czechoslovakia; regarding the recent discovery of *Astiosoma rufifrons* Duda, 1927 in England, this genus might also occur in our territory.

Selected literature: Máca J., 1976: A contribution to the knowledge of Diptera in Southern Bohemia. *Sbor. Jihočes. Muz. Čes. Budějovicích, Přír. Vědy*, **16**: 103–140. — Papp L., 1973: Trágyalegyek — harmatlegyek — Sphaeroceridae — Drosophilidae. *Fauna Hungariae*, **112**: 1–146. — Roháček J., 1980: Faunistic records from Czechoslovakia, Diptera, Asteiidae. *Acta ent. bohemoslov.*, **77**: 347.

TETHINIDAE

Jindřich ROHÁČEK

Only Zuska et Laštovka (1969) have previously recorded a representative [*Pelomyia* sp.] of this family from Czechoslovakia. Recently Roháček (1983) found 2 species of the genus *Pelomyiella* in South Slovakia. However, it is probable that one additional species of the latter genus and several of the genera *Tethina* Haliday, 1838 and or *Rhinoessa* Loew, 1862 also occur in salty habitats of Czechoslovakia.

Selected literature: Roháček J., 1983: New records of Tethinidae (Diptera) from Slovakia. *Biológia*, Bratislava, **38**: 1021—1023. — Zuska J. et Laštovka P., 1969: Species-composition of the dipterous fauna in various types of food-processing plants in Czechoslovakia. *Acta ent. bohemoslov.*, **66**: 201—221.

ACARTOPHTHALMIDAE

Jindřich ROHÁČEK

The list is based on the revision of all available Czechoslovakian material by Máca et Roháček (1983) comprising about 100 specimens, and the record of both our species by Vaňhara (1983) from Moravia. The occurrence of the third European species of the family, viz. *Acartophthalmus pusio* Frey, 1946, is to be expected in Czechoslovakia with certainty.

Selected literature: Máca J. et Roháček J., 1983: Review of findings of the family Acartophthalmidae (Diptera) in Czechoslovakia. *Čas. Slez. Muz. (A)*, **32**: 233—237. — Vaňhara J., 1983: Spruce monoculture Diptera (Brachycera, Cyclorrhapha). *Acta sci. natur. Acad. Sci. bohemoslov. Brno*, **17** (8): 1—26.

CARNIDAE

František GREGOR

Up to the papers by Balát et Bauer [1955], Gregor et Povolný (1961), Doskočil (1962) and Doskočil et Hůrka [1962] who give 6 species of the family Carnidae for the fauna of Czechoslovakia, there exist only two unrevised data on *M. obscurella* (Fall.) by Czižek [1907] and Vimmer [1913]. After 1970 Gregor dealt with the Czechoslovak *Meoneura* in detail and he described two new species [Gregor, 1973]. A comprehensive work on extensive material of the genus *Meoneura* from Czechoslovakia was carried out by Gregor et Papp [1981]. Data concerning occurrence in Czechoslovakia by Papp [1978] are based on the same material. Further important contributions to the knowledge of the family Carnidae is brought in the paper by Roháček et Gregor (1984).

Selected literature: Balát F. et Bauer Z., 1955: K poznání potravy a hnízdění našich poštolek. *Zool. ent. MILICHIIDAE

František GREGOR

There exist only scattered literary data to 1945 on the faunistics of the members of the family Milichiidae in the territory of Czechoslovakia [Czižek, 1908 and 1910; Vimmer 1913 and 1931]. The corresponding materials were not yet revised. The first confirmed data are by Hendel (1919 and 1924) who described two new species of the genus *Phyllomyza* from north Moravia. Further studies brought only a few data (Doskočil, 1973; Doskočil et Hürka, 1962; Hennig 1937; Máca 1976; Papp, 1978). New findings of considerable importance are given by Roháček et Gregor (1984). At present 7 genera and 15 species are known, the number of genera may increase to 8 and the number of species to 20.

CHLOROPIDAE

Jan ZUSKA

This family of great economic importance has never been studied in detail in Czechoslovakia. Many faunistic records are scattered in the literature — not only in general taxonomic and faunistic papers on flies [e.g. Soós, 1943; Draskovits, 1964; Doskočil et Chvála, 1971; Dely-Draskovits, 1978], but also in phytopathological and cecidological contributions. The present list is mainly compiled from the author's collection. Unfortunately, only a small part of the available institutional collections was studied. Some published records were disregarded. At present 116 species are known to occur in Czechoslovakia but at least 30 additional species are expected to be discovered in the future.

Selected literature: Doskočil J. et Chvála M., 1971: A revision of *Lipara* Meigen (Diptera, Chloropidae), including the description of a new species from Europe. *Acta ent. bohemoslov.*, **68**: 100—107. — Draskovits Á., 1964: Angaben zur Kenntnis der Chloropiden in Ungarn I. Die Gattung *Elachiptera* Macq. *Rovart. Közlem.*, **17**: 419—432. — Dely-Draskovits Á.: 1978: 75. család: Chloropidae — Gabonalegyek. Fauna Hungariae, **133**: 61—202.

BRAULIDAE

Oldřich HARAGSIM

The list is based on mature stages determined by Örösi. A modern key for determination of *Braula* subspecies was published by Örösi [1966].

Selected literature: Örösi P. Z., 1966: Die Bienenlaus — Arten. *Angew. Parasit.*, 7 (3): 138—171. — Svoboda J., Haragsimová L., Hanko J. et Haragsim O., 1968: Braulidae. In: Nemoci a škůdci včely medonosné, pp. 143—146, SZN, Praha.

Braula Nitzsch, 1818*coeca coeca* Nitzsch, 1818 B M S**SCATOPHAGIDAE**

František ŠIFNER

The Scatophagidae of our territory has never been listed comprehensively, the basis faunistic reviews being those of Kowars [1894] and Vimmer [1913]. Recently the family has been studied intensively by the author, both taxonomically and faunistically.

The list is based on records of adult individuals and only represents the present status of current research. All published records from our territory were critically evaluated and all the pertinent materials of Czechoslovak museums, of the Natural History Museum in Vienna, of the Hungarian Natural History Museum in Budapest and of the author's private collection were studied. In certain dubious species [e.g. *Americina* and *Delina*] types were revised. A revision of the genus *Amaurosoma* is needed. At present 29 genera and 57 species are known from the territory of Czechoslovakia; altogether some 70 species may be expected.

Selected literature: Šifner F., 1969: Poznámky k rozšíření Scatophagidae (Diptera) v Československu. *Sbor. Ped. F. ANTHOMYIIDAE

Rudolf ROZKOŠNÝ

Numerous records published in scattered papers before World War II need a revision. The list presented here is based on the reliable data included in papers by Stein (1906, 1916), Aczél (1938, 1940), Hennig's monograph (1966—1976), and a series of recent faunistic studies. Some reliable identified species are also to be found in several papers on synanthropic flies produced by F. Gregor, A. Řehůrková, J. Křištofík, P. Laštovka, D. Povolný, J. Zuska and others or in studies dealing with forest, field and garden pests (e.g. papers by K. Dirlbek, J. Dušek, M. Řezáč, V. Skuhřavý). Many records of various value are included in lists of gall forming and mining Diptera found in the ČSSR (especially studies by E. Baudyš, E. Bayer, L. F. Černík, J. Hubáček, B. Kvíčala, J. Seidel, B. Starý, A. Vimmer, and H. Zavřel). The modern faunistic research has been started only recently and results have been partly published by Čepelák (1972, 1974, 1979a—1985), Čepelák et Čepelák (1983), Lauterer (1978), Máca (1977), Rozkošný (1977, 1978), Teschner (1978), Vaňhara (1981, 1983), Barták et Rozkošný (1984), and Rozkošný et Barták (1984, 1985). The faunistic investigation of the family is far from finished and a relatively large number of species will certainly be added to this list in the near future.

FANNIIDAE

František GREGOR

The genera of this family were originally included in the family Anthomyiidae s. l. and, but for minor exceptions, have existed as a subfamily Fanniinae within the family Muscidae from approximately 1920 up to present. Our literature contains no separate publication on this group and individual faunistic data can be found in most papers mentioned in the chapter on Muscidae of this Check-list. Of the earlier literature, this list does not contain the important paper by Stein (1895) containing descriptions of six new species of *Fannia* from Bohemia. Of fundamental importance is the monograph by Hennig (1955—1964), see under Muscidae. A development of studies of synanthropic diptera after 1960 (Gregor et Povolný, Havlík et al., Husárová et al.) has mostly provided data on the common species and hence only the papers of greatest faunal importance from among these studies are mentioned in the Selected literature section. Similarly, only some of the numerous faunal studies by Čepelák have been selected. A revision of the collections of Czižek, Landrock and Slavíček in the MMB has been carried out by Gregor and has been considered in this list. Earlier material deposited in the NMP has been revised only in part. The fairly rich collections of various recent authors are being elaborated and one may expect that the number of 50 species mentioned below as occurring in the territory of Czechoslovakia may soon increase to 60.

MUSCIDAE

František GREGOR

Faunal investigations on the members of the present family Muscidae developed to a considerable extent independently in Bohemia, Moravia and Slovakia until the middle of the present century. As for Bohemia, the first rather comprehensive list of species was published by Dalla Torre (1878) and then Kowarz (1894) reported some 100 species. Their data, together with his own successively published findings, were summarised by Vimmer (1913) who thus attained the total of 130 species. Hennig (1955—64) did not adopt data published in Czech periodicals but listed a large number of localities from the materials kept in the DEI, ZMB and the Leningrad Museum and cited faunal data published in foreign periodicals (Kramer, 1917; Stein, 1916; etc.). In the subsequent period, except for the rather comprehensive study by Mácá (1976), faunal data for Bohemia were sporadically published during the past decade (Čepelák, 1979b, 1983; Gregor et Minář, 1977; Havlík et Bařová, 1960; etc.). The earliest period of faunal investigations in Moravia was essentially started by Strobl's 1901 list and culminated in 1910 (Cziřek, 1906—1908, 1910; Landrock 1907a, b, 1908, 1910), apart from minor papers by additional authors Canon (1927), Eiselt (1846), Fritsch (1875), Kolonati (1895), Slavíček (1930), Stein (1893, 1916), etc. Hennig l. c. included many localities in the region of the Hrubý Jeseník Mts. on the basis of his revision of materials in the DEI, ZMB and the Leningrad Museum. Again, a period of intensive faunal investigations started as late as 1975 (Čepelák, 1982; Gregor, 1982, 1984; Gregor et Barták, 1984; Vaňhara, 1981). In Slovakia, after the first important paper by Kowarz (1883), it was mainly Hungarian dipterists who published faunal data (Aczél, 1938b, 1940a; Barta, 1906; Brancsik, 1910; Fekete, 1914; Thalhammer, 1899 etc.). Hennig (l. c.) adopted only several data from Aczél (l. c.), Thalhammer (l. c.) and Stein (1916); he himself revised materials mainly from the region of the High Tatra Mts. The results of systematic faunal investigations in Slovakia were published by Čepelák and Čepelák et al. (see Selected literature). Additional data are scattered in the papers by various authors (Gregor and Gregor et al., [l. c.]; Husárová, 1965, 1973; Sztankay-Gulyás 1953; etc.). — The degrees to which the individual territories have been investigated are much the same: Bohemia 209, Moravia 203 and Slovakia 214 taxa recorded. The total number of taxa recorded for Czechoslovakia is 262; the probable number of additional, hitherto unrecorded, species occurring in this country may be estimated at 25.

HIPPOBOSCIDAE

Josef CHALUPSKÝ and Dalibor POVOLNÝ

A relatively well known family in Czechoslovakia, presented already in the classic articles of Kowarz [1894], Thalhammer [1899], Branczik [1910], Czižek [1910], Landrock [1908, 1910] and Vimmer [1913, 1931]. A more recent basis for its study has been published by Povolný et Rosický [1955]. The papers dealing with the species found later as new to our fauna are — Povolný et Balát [1956], Theodor [1967], Macháček et Roháček [1975], Chalupský et Macháček [1977], Chalupský et Povolný [1983]. A monographic paper by Chalupský [1980] involves all species which are to be found in this country. Some other species could be anticipated as either quite accidental introductions or, if *Apus melba* nests permanently in Slovakia, *Crataerina melbae* [Rondani, 1879] could be found. Economic and medically important species have also been mentioned in various books of parasitology. All our species are well characterized, the only uncertainty exists between *Ornithomya fringillina* and *O. chloropus*. The record of *Ornithophila gestroi* Rondani, 1878 from Czechoslovakia was a mistake. About 150 species have been described from the whole world, 19 are known from here.

Selected literature: Chalupský J., 1980: Čeleď Hippoboscidae — klošovití. In Chvála M. (ed.), Krevsajcí mouchy a střečci, Fauna ČSSR, sv. 22, pp. 447—476. Academia, Praha. — Chalupský J. et Macháček P., 1977: A find of *Icosta minor* (Bigot, 1858) [Diptera, Hippoboscidae] in Central Europe. *Folia parasitol.*, Praha, 24: 372. — Chalupský J. et Povolný D., 1983: Additional notes to a list of the Czechoslovak Hippoboscidae. *Acta Univ. agric. (Brno)*, 31: 137—142. — Krištofik J. et Štefan P., 1980: K poznání čeledi Hippoboscidae [Diptera] na Slovensku. *Biológia*, Bratislava, 35: 137—140. — Pomykal J., 1982: Příspěvek k ektoparazitické fauně našich ptáků. *Zprávy ěs. ornithol. spol.*, 23: 25—30. — Povolný D. et Balát F., 1956: Doplněk znalosti československých klošovitých [Hippoboscidae, Diptera]. *Folia Zool.*, 5: 390—394. — Povolný D. et Rosický B., 1955: Faunisticko-bionomický nástin klošovitých [Hippoboscidae, Diptera] z území ČSR. *Folia Zool.*, 4: 5—20. — Macháček P. et Roháček J., 1975: Hippoboscidae [Diptera] found on sparrows in southern Moravia. *Folia parasitol.*, Praha, 22: 170. — Theodor O., 1965: *Lipoptena parvula* n. sp., eine neue Art aus der Tschechoslowakei [Diptera, Hippoboscidae]. *Acta ent. Mus. Nat. Praeae*, 37: 275—278.

The abbreviation „introd.“ means the species undoubtedly introduced. The abbreviation of country in paranthesis means that the species probably exists there, too, but for the present not documented by material.

NYCTERIBIIDAE

Karel HŮRKA

The earliest data from our territory are given in the classical works by Kolenati (1856, 1863). Further special attention to the study of the family was paid as much as after about 100 years in the papers by Grulich et Povolný (1955, 1956), Šebek (1958a, b, 1962) and Hůrka (1958, 1959, 1963, 1964). All previous literary data from the territory of Czechoslovakia are summarized and evaluated in the author's paper from 1964. Some new faunistic data from Slovakia gives Krištofik (1982), from Czechoslovakia Hůrka (1984). The list is based on the verified literary data and on the rich and purposely collected author's material, both are also the bases for author's elaboration of family in Fauna ČSSR (1980). Taxonomy and faunistics of the Central European species are satisfactorily solved. Ten species in four genera have been found in Czechoslovakia, the occurrence of *Basilia nattereri* (Kolenati) being yet possible. The species in the genera are listed in an alphabetical order.

CALLIPHORIDAE

František GREGOR

So far nobody has worked out the family Calliphoridae as a whole from the territory of Czechoslovakia. Most of the literary data on the faunistics from the past and from the beginning this century remained unrevised (Czižek, 1906, 1910; Bartal, 1906; Brancsik, 1910; Eiselt, 1846; Hetschko, 1916; Kolenati, 1859; Kowarz, 1894; Strobl, 1901; Vimmer, 1913; and others). After 1930, Jacentkovský (1934a, 1935a, 1936a—c, 1939a, 1939c, 1940a, 1941a—c, 1942a, 1942d, 1944a) intensively collected material, principally in southern Moravia, and he described several new species of the genus *Pollenia* from Czechoslovakia. The important monograph by Zumpt (1956) reports 20 species of Calliphoridae from the territory of Czechoslovakia. A detailed study was devoted to the subfamily Phormiini (Gregor et Povolný, 1959). A revision of the genera *Onesia*, *Bellardia* and *Melinda* by Schumann (1973, 1974) comprises also rich material of these genera from Czechoslovakia but localities are given only for *Onesia* spp. Numerous faunistic data from the territory of Slovakia are given by Čepelák and Čepelák et al., including a description of one new species of *Cynomya*. The number of species of the family Calliphoridae from Czechoslovakia is 52, and it might grow only very negligibly in future. *Chrysomya albiceps* is not a permanent member of our fauna; it invaded Czechoslovakia temporarily during 1958.

SARCOPHAGIDAE

Juraj ČEPELÁK, Mária SLAMEČKOVÁ and Milan STANĚK

The unfinished taxonomy of a number of genera requires a repeated revision, especially of the older findings in the museum collections. The list set forward is based on imago faunistics. It is founded on the well investigated territory of Slovakia and the other less well known parts of the Republic.

The older data in the territory of Bohemia have been summed up by Vimmer (1913), in Moravia by Czižek (1906, 1907, 1908, 1910) and Landrock (1907, 1908, 1910), in Slovakia by Thalhammer (1899), Brancsik (1908—1910) and Fekete (1914). Already on a modern basis, the knowledge was extended mainly in Moravia by Jacentkovský (1941). Under the influence of his work more systematic attention began to be given to this group by Čepelák (1952, 1956, 1959). His results were followed by Slamečková who summed up a number of her separately published results in 1977, by Povolný (1977) and Staněk (1971, 1973). Valuable studies have been published by Povolný et Slamečková (1959, 1967, 1970), and Povolný et Staněk (1972, 1975). Povolný together with Gregor directed their results to the problems of synantropy (1961). Of the same direction are also the works of Husárová and her coworkers (1965, 1970, 1972, 1973).

In the territory of ČSSR there have been found 126 species belonging to 42 genera. Since the main attention was received by the subfamily Sarcophaginae, many other species from other subfamilies may be supposed to occur as well.

RHINOPHORIDAE

Juraj ČEPELÁK

The groups is given little attention in this country as well as abroad. The revisions are not sufficient and there is also little material for study. The list is based on imago faunistics.

The older data in Bohemia were summed up by Vimmer (1913), in Moravia by Jacentkovský (1941), in Slovakia by Thalhammer (1889) and Brancsik (1908—1910). The representatives of the group are newly given systematic attention by Čepelák who has exploited his results in the key (1977).

GASTEROPHILIDAE, OESTRIDAE, HYPODERMATIDAE

Jan MINÁŘ and Dalibor POVOLNÝ

Of the families Gasterophilidae, Oestridae, and Hypodermatidae primarily studied were some economically important species parasitic on domestic and game animals. The occurrence of these species in Czechoslovak territory was recorded in very old entomological works (Bartholomeides, 1789; Grossinger, 1794), in the first comprehensive dipterological treatises (Kowarz, 1894; Thalhammer, 1899; Vimmer, 1931) and lesser papers dealing with particular species of veterinary importance (Chládek, 1928; Komárek, 1944; etc). In the post-war period some new data were published concerning the occurrence of gad-flies in Czechoslovakia, mainly *Hypoderma bovis* (Povolný et Vrba, 1962; Sokol et al., 1972; Minář, 1974; etc), *Cephenemyia stimulator* (Dyk et Dyková, 1962) and *Oestromyia leporina* (Povolný et al., 1960). A total of 11 species were listed in the paper dealing with the occurrence of gadflies, botflies and warble flies belonging to these families in Czechoslovakia (Minář 1972).

Based on the material of adults and larvae collected by the authors, on the revision of museum collections and reliable published data the following list of gadflies of Czechoslovakia has been made, consisting of one genus and four species of the family Gasterophilidae, for genera and five species of family Oestridae and two genera and five species of the family Hypodermatidae (a total of 14 species). The occurrence of other species belonging to these families may be anticipated sporadically only, mainly because of the specificity of particular parasite species to hosts. A more detailed faunistic as well as ecological research is under way in different regions of the Czechoslovak Socialist Republic.

TACHINIDAE

Juraj ČEPELÁK

Revisions of the material of older authors were carried out but the changes in the taxonomy of some genera and species lately require further partial revisions. The list presented is based on long term systematic imago collections supplemented by the knowledge gained from rearings of many hosts as well. The territory of Slovakia and also for a great part of Moravia is sufficiently investigated but there is little information on Bohemia.

The older data from Bohemia have been summed up and supplemented by Vimmer (1913), in Moravia Jacentkovský (1941) worked very intensively. He also summed up and supplemented up-to-that-time somewhat less knowledge on the fauna of Slovakia (1941). Later their results were systematically followed by Čepelák. First he began in the surroundings of Prague (1952), continued in Moravia (1955, 1956, 1958, 1959, 1961a) and, above all, systematically in Slovakia. Especially these results are the basis in the *Tachina* key (1977).

Up to this day, in the territory of ČSSR there are registered 461 species belonging to 217 genera. Collections in the uninvestigated territory as well as the revisions mentioned will certainly bring other species new for the ČSSR fauna and for science as well. This would also be contributed by the observation of parasitism of less common hosts.
